Associazione Italiana Donne per lo Sviluppo (AIDOS)

The Italian Association for women in Development is a non governmental, non profit organisation established in Rome in 1981 by a group of women development professional and activists with the intent of carrying out the goals of the UN decade for women: equality, development, peace. Its mission is to support the concept and the methodology of women's empowerment by reinforcing women's organisations and NGOs in developing countries, enabling them to respond to women's needs and to manage their interventions autonomously.

Research Action and Information Network for the Bodily Integrity of Women (RAINBO)

RAINBO is an African led international nongovernmental organisation working on issues of women's empowerment, gender, reproductive health, sexual autonomy and freedom from violence. RAINBO specifically strives to enhance global efforts to eliminate the practice of Female Genital Mutilation (FGM) through facilitating women's selfempowerment and accelerating social change. RAINBO is based in London and its work is aimed at influencing European development assistance to Africa whilst taking advantage of the closer proximity to Africa.

FGM/C as a development issue

Programming tools
to mainstream
the abandonment of
FGM/C into development
programs and projects

PREFACE

AIDOS, the Italian Association for Women in Development, an NGO active in the area of women's rights and empowerment since 1981, and RAINBO, an organisation of African women based in London and focusing on the bodily integrity of women, are partner in the project "Innovative tools for the abandonment of the practice of female genital mutilation/cutting (FGM/C)". The project aims at strengthening the capacities of local development, health and human rights NGOs as well as governmental agencies to design, implement, monitor and evaluate FGM/C prevention activities through a training methodology that promotes the mainstreaming of FGM/C into on going programmes and projects as an issue of gender, human rights, reproductive health and sexuality.

Why

The action aims to contribute to the abandonment of female genital mutilation/cutting (FGM/C) in Africa by increasing the number of actors involved in preventing and contrasting the practice, as well as by introducing FGM/C prevention activities into all kind of development program and projects, in particular those addressing issues such as health, in particular reproductive and sexual health, HIV/AIDS, human rights, women's rights, women's empowerment, education, poverty eradication, etc. In particular, it aims to strengthen the capacities of governmental agencies as well as local development, health and human rights NGOs to design, implement, monitor and evaluate FGM/C prevention activities through a training methodology that promotes the mainstreaming of FGM/C into on going programmes and projects as an issue of gender, human rights, reproductive health and sexuality; and to promote advocacy and awareness-raising actions, including dealing with the media.

Who

The project is co-ordinated by AIDOS, the Italian Association for Women in Development, a women NGO based in Rome (Italy) and founded in 1981 to work for the human rights, dignity and right to choose of women in developing countries relying on the experience of Italian women in the areas of reproductive and sexual health, economic empowerment, capacity building, human rights of women and prevention of gender based violence, together with RAINBO, the Research, Action & Information Network for Bodily Integrity of Women. Since its establishment in 1994, RAINBO's mandate has been to work on issues that intersect between health and human rights and in particular those related to sexuality and reproduction. RAINBO has played a key role in leading efforts to stop FGM/C. Target groups include: planners and program officers of government agencies as well as of NGOs working in the areas of poverty eradication, development, health, including reproductive health, prevention of STDs including HIV/AIDS, human rights, women's empowerment and gender issues. The project is co-funded by the European Union under the European Initiative for Democracy and Human Rights – Prevention of Torture budget line.

What

Activities include:

The development of a joint training curriculum on "Programming in the area of FGM/C prevention", based on AIDOS manual for programming "Mainstreaming the fight for the abandonment of FGM/C" and RAINBO's "WECC – Women's Empowerment Community Consensus" programming model.

The organisation of three training courses in Sudan, Kenya (by RAINBO and its local partners) and Tanzania (by AIDOS and its local partners) respectively, aimed at sharing this programming tool with target groups' representatives, including development NGOs, representatives of International organisations and of governmental agencies.

The development of a training tool on "Dealing with the media to build a socio-cultural environment facilitating the abandonment of FGM/C" by AIDOS in partnership with local organisations in Sudan and Kenya.

Two workshops on "Dealing with the media for the abandonment of FGM/C", in Sudan in collaboration with BBSAWS – Afhad University and in Kenya in collaboration with AMWIK, for NGOs, governmental agencies and others working in the area of prevention of FGM/C.

A final evaluation of the use of the new programming tool by organizations and governmental agencies involved in the trainings in the three countries.

CONTENTS

Module 1: Introduction7

- Activity 1: Getting to know the issue and each other
- Activity 2: Names and clarifying hopes and expectations
- Activity 3: Developing a group contract

Module 2: Gender and FGM/C19

- Activity 1: Differentiating between sex and gender
- Activity 2: Division of labour
- Activity 3: Access and control over resources
- Activity 4: FGM/C and sexual and reproductive rights

Module 3: Understanding FGM/C in changing societies looking at power dynamics57

- Activity 1: Myths and realities behind the practice
- Activity 2: Is FGM/C a women's affair?
- Activity 3: Is FGM/C a religious practice?
- Activity 2: FGM/C, power and empowerment

Module 4: Mainstreaming FGM/C prevention in development103

- Activity 1: Behavioural and social change models
- Activity 2: FGM/C prevention: review of past approaches
- Activity 3: Programming tools for mainstreaming FGM/C

Module 5: Building blocks for programming149

- Activity 1: Women's empowerment and community consensus inputs
- Activity 2: Can the law be used to stop/prevent FGM/C?
- Activity 3: Indicators for monitoring and evaluation
- Activity 4: Mainstreaming FGM/C prevention: develop your program

OVERALL OBJECTIVES

1. To make participants understand that FGM/C is:
 - a) a gender issues
 - b) a violation of human rights that impacts on the development of women and communities
 - c) a serious infringement of sexual and reproductive rights of women/girls
2. To analyse the cultural environment, the reasons behind the practice and the causes of the persistence of the practice
3. To understand the positive and negative effects of various types of interventions to prevent FGM/C for different target groups
4. To share innovative tools for the mainstreaming of the abandonment of FGM/C into development programmes/projects
5. To recognise the importance of research, monitoring and evaluation for programmes/projects in the field of FGM/C
7. To understand the role that legal and policy measures can play in the framework of development interventions to stop FGM/C

COURSE STRUCTURE

Module	Activity	Time for activity	Total time for module
Module 1 Introduction	1. Getting to know the issue & each other	30 minutes	2 hours
	2. Names and clarifying hopes and expectations	45 minutes	
	3. Developing a group contract	45 minutes	
Module 2 Gender Abd FGM/C	1. Differentiating between sex and gender	1 hour and 15 minutes	4 hours and 45 minutes
	2. Division of labour	1 hour and 30 minutes	
	3. Access and control over resources	1 hour	
	4. FGM/C and sexual and reproductive rights	1 hour	
Module 3 Understanding FGM/C in changing societies looking at power dynamics	1. Myths and realities behind the practice	1 hour	4 hours and 45 minutes
	2. Is FGM/C a women's affair?	1 hour and 15 minutes	
	3. Is FGM/C a religious practice?	1 hour and 15 minutes	
	4. FGM/C: power and empowerment	1 hour and 15 minutes	
Module 4 Mainstreaming FGM/C prevention in development projects	1. Behavioural and social change models	2 hours	4 hours and 45 minutes
	2. FGM/C prevention: Review of past approaches	1 hour and 15 minutes	
	3. Programming tools for mainstreaming FGM/C in development programs	1 hour and 30 minutes	
Module 5 Building blocks for programming	1. Women's empowerment and community consensus inputs	2 hours	11 hours
	2. Can the law be used to stop FGM/C?	1 hour	
	3. Indicators for monitoring and evaluation	1 hour	
	4. Mainstreaming FGM/C prevention: develop your program	8 hours	

COURSE TIMETABLE

	Afternoon	Presentation of projects, workshop evaluation, closing

MODULE 1

1

INTRODUCTION

Purpose of this manual

The manual has been developed by AIDOS and RAINBO in the framework of the project “Innovative tools for the abandonment of the practice of female genital mutilation/cutting (FGM)”, co-financed by the European Commission, as a contribution to the on going activities for the abandonment of the practice of FGM/C. It has been developed for the training of senior planners and managers in government, non governmental organisations and funding agencies, working in the areas of sexual and reproductive health, women’s empowerment, poverty eradication, in order to raise their consciousness about the need to address FGM/C in development programmes and projects as an issue of gender, human rights and sexual and reproductive health and rights. At the end of the course they will be able, with some technical assistance of local specialised NGOs and institutions, to integrate the fight for the abandonment of FGM/C into on going and future programmes/projects.

Who the manual is for

The manual has been developed for skilled trainers. It is anticipated that the trainers will follow and adapt as appropriate the modules and activities presented. Trainers are required to have a good understanding of gender and human rights issues and be knowledgeable of FGM/C in their own community. Trainers should be experienced in participatory adult learning methods and able to facilitate group learning. Trainers require also good knowledge of project planning in order to assist participants to integrate FGM/C in their programmes/projects as an issue of gender, human rights and health.

Target group for training

The target group for the training is senior planners and managers in government, non governmental organisations and funding agencies, who are responsible for designing and implementing development programmes and projects within planned poverty reduction strategies, in order to make them understand correctly the facts about FGM/C and knowledgeable about the most innovative and successful interventions. Programme officers would also benefit from the training. While this week long training course is not intended for policy makers and politicians, certain activities can be used in a short advocacy intervention for such an audience. Many of the methods are also appropriate for and can be adapted by NGOs and Government officials for use at community level.

1 Content and methods

Because FGM/C as well as gender are very sensitive subjects and the consciousness of people needs to be raised in order to change attitudes and values, it is important that participants in the course have the opportunity to share their own experiences, ideas beliefs and cultural values as much as possible. This helps to reduce anxieties. The methodology used in the manual is highly participatory, with small group discussions, buzz discussions and discussions in plenary and role-play. Most of the content is generated by the participants themselves, who are guided by the facilitators. The lectures are kept to a minimum.

Note to trainers

Trainers should prepare by reading through the entire manual. References to key readings that will enhance the conceptual framework within which the trainer works have been included. Trainers should take the time to read these. Trainers who are not sure about certain activities may want to do a trial run to test them out. Each activity has a section called "Materials", the trainer should read this and ensure that he/she has all that is required. "Handouts" and "Overheads" have been included and the format of the manual is such that the trainer should simply photocopy these for participants. If a trainer adapts the course, he/she needs to prepare locally specific overheads and handouts.

Activities:

Activity 1: Getting to know the issues and each other

Activity 2: Names and clarifying hopes and expectations

Activity 3: Developing a group contract

Total Time: 1 hour and 30 minutes

Activity 1

1

GETTING TO KNOW THE ISSUES AND EACH OTHER

Time: 20 minutes

Why do this activity?

This activity has two purposes. The first is to get participants comfortable with each other and to create a light-hearted and relaxed atmosphere. It helps to break down barriers and hierarchies between participants. Also, by the end of the exercise, each participant will have spoken to at least six other participants, making speaking again easier.

The second purpose of this activity is to get participants thinking about the issues that the course focuses on. Participants may have walked into the course worrying about personal family matters, or thinking about a proposal they have to submit to a donor. This step helps to orient everyone.

While it may seem strange to begin the course before people have formally introduced themselves (activity 2), in reality beginning with this activity means that even the formal introductions in activity 2 are heard better by participants, and they feel more relaxed in doing them.

How to do this activity

Plenary

Divide the participants into two groups. Get one group to form an inner circle and the other group to form an outer circle. People from the inner circle turn to face someone in the outer circle. You need even numbers of participants.

This is how the whole exercise works: You will give the group a word. The people on the inside circle must then talk about that word - anything that they want to say about that word - for half a minute. Their partner (facing them on the outside circle) may not interrupt. When you call or ring a bell to show the time is over, the partner has one minute to talk about the same word from her/his perspective. When that time is over, ask the people in the outside circle to all take a step to the right, so that they are facing a new person. You start the process again with a new word. Continue in this fashion.

Note that you should choose words that will be particularly meaningful to

this group of people, given the kind of work that they do, the social/cultural environment they live in etc. You want to choose words which push participants to talk about things they may not usually talk about. At the same time you do not want to cause great embarrassment or discomfort.

You should start with words that are more neutral and move on to words that require reflection on questions of human rights and values. Some words are suggested below :

- Rural life
- Women's role in the family
- Maternal deaths
- Human rights
- Violence against women
- Female genital mutilation / cutting
- AIDS
- Men's role in parenting

You should do between six and eight words, depending on how much time you have and how well you think the exercise is working. The exercise usually makes people laugh. They get very frustrated when you tell them to stop, and you have to be very firm that it is time to move on to their partners' chance.

When you stop, you can ask the group if they enjoyed the activity. Then ask them to take their seats.

Explain to the group that the issues they have been discussing are the issues that will be covered in this course.

Say that now that you are all comfortable with each other, it's time to make formal introductions. Go on to activity 2 to do the introductions.

Materials:

- A watch or clock so that you can stop participants after each minute.
- A bell so that participants can hear you when you tell them to stop talking.

Activity 2

1

NAMES AND CLARIFYING HOPES AND EXPECTATIONS

Time:40 minutes

Why do this activity?

This activity will help people to get to know each others' names and some basic information about each person. This information will help participants and the facilitator understand how the course content is relevant to each individual's work situation.

If this course is being run with participants who all know each other well, then the facilitator might rather want to explore more personal questions.

This activity will also give participants an opportunity to talk about what they are hoping to gain from this course. This will allow the facilitator to ensure that participants' expectations match the content of the course, and where expectations cannot be met by the course, she / he can make this clear, so that participants do not have unrealistic expectations and land up being disappointed by the course.

How to do this activity

Plenary

Write down the following questions on a flipchart:

- Name?
- Organisation you work for?
- What work do you do there?
- What are you leaving behind while you are attending this course?

Ask participants firstly to write their names (as they want to be addressed during the course) in a thick pen on a piece of cardboard folded in half. They should put this up in front of them so everyone can read their names.

Then give them five minutes to think about their answers to the questions you have written up. Explain that you do not want a lot of detail, but just a few sentences to help us know each other.

In relation to the question "What are you leaving behind while you are

attending this course?”, tell the participants that you want to know what personal or work-related things will be worrying them.

Then go around the room giving each person a chance to answer the questions.

When they are all done, tell participants that you asked them to share what they are leaving behind so that they could be aware of what is on their minds.

Take five minutes to introduce yourself, then the co-trainer and assistant to the training course should also introduce themselves. Tell participants also what you are leaving behind.

Now, however, they must really leave these things behind. They have a special opportunity to focus on one issue for the week of the course. They should use this time to focus on the course and on what lessons they can learn from it to take back to the workplace.

Materials:

- X number of pieces of cardboard folded across the middle so that they can stand on a table. These are for participants to write their names on.
- Felt-tip pens so that the names can be read by everyone in the room.

Activity 3

1

DEVELOPING A GROUP CONTRACT

Time: 30 minutes

Why do this activity?

Often participants in one course come from different work cultures with different ways of behaving in group settings - for example, some institutions and NGOs may allow free and open discussion while others might have a culture in which only the management speak. Also, in many organisations, those in decision-making positions have a greater right to speak and generally to take up space in a meeting than those who are not managers.

However, this course is about building a culture of equity/equality. This means that the course itself has to be run in a way which accords all participants equal respect and an equal chance to express their opinions.

For this reason, it is necessary to set up some ground rules for how the course will be run, and to make sure that everyone on the course is happy with and agrees to abide by these rules. Since the course promotes the idea of participation, it is important that these ground rules are developed in a participatory way, which is why this activity involves everyone in developing the group contract.

There may be other things, such as whether or not people can smoke in the workshop room or whether they should keep their cell phones switched off, which need to be agreed upon in advance, so that little irritations do not undermine people's ability to enjoy the course or to concentrate during the course.

How to do this activity

Plenary Ask participants to write using three different coloured cards:

- Their expectations from the course;
- Their anxieties about the course process;
- What they can contribute to ensure that the group works well during the ... course.

Then paste these different cards at three different places. This might include things like:

Expectations

- Learn more about FGM/C issues focusing on gender dimensions / human rights;
- Being gender sensitive while planning and implementing a project;
- Learning relationship of FGM/C with gender, human rights and health issues.

Anxieties

- Fear that they will be too shy to participate;
- Fear that there will be too much work;
- Women who fear that men will not listen to the women;
- Men who fear that men will be accused of being bad people;
- Fear of being attacked for having a different view from other participants;
- Fear that personal stories told in this workshop will then be spread to workmates or social friends.

Contributions

- No individual should dominate discussions;
- People should raise a hand if they want to speak and wait for the facilitator to ask them to do so;
- No personal attacks; people should respect each others' right to speak;
- Everything personal that is said in the course will be kept confidential;
- We are all responsible to speak when we have something to say;
- We are all responsible for our own learning.

Explain the group that through their contributions, their anxieties as well as some of their expectations can be met.

Write the list of contributions on a new piece of paper. Once the group is happy with the list, you can label it "Group Contract" and ask if everyone is happy to abide by this agreement.

The group contract should be pasted on the wall and stay up for all to see throughout the course.

During the course, if there are problems with group dynamics, remind participants of the relevant commitments in the group contract.

Concluding presentation

On the first day of a course it is not easy for participants to take in a lot of detail about the course as a whole. But they do need to know where the course aims to go, so that they do not get anxious in the first day or two that their needs will not be met.

Providing an outline of the course and its methods also gives the facilitator an opportunity to go back to the expectations raised by the participants in activity 2 and to show where different expectations will be met.

Put up the Overhead 1 on Overall Course Objectives. Go through each of these objectives, spelling out the content of each objective and clarifying any questions participants may have on each objective.

Then put up the Overhead 2 on Structure of the Course. Explain that the course is not structured so that there is one section for each objective. Some objectives are dealt with throughout the course, such as building a common understanding of key concepts, and re-evaluating their own programmes.

Note to facilitator

Plenary

Overheads

Explain that the course structure aims to build concepts, one upon the next.

Briefly explain what each module does. As you do this, refer back to participants expectations of the course, raised in the previous activity, so you can show where the course addresses these.

Materials:

- 3 sets of coloured cards
- Flip chart
- Paper
- 3 boards
- Felt-tip pens
- Something to stick the flip chart to the wall with.

Overheads:

- Overhead 1: Overall Course Objectives
- Overhead 2: Structure of the Course

OVERALL OBJECTIVES OF THE COURSE:

1. To make participants understand that FGM/C is:
 - a) a gender issues
 - b) a violation of human rights that impacts on the development of women and communities
 - c) a serious infringement of sexual and reproductive rights of women/girls
2. To analyse the cultural environment, the reasons behind the practice and the causes of the persistence of the practice
3. To understand the positive and negative effects of various types of interventions to prevent FGM/C for different target groups
4. To share innovative tools for the mainstreaming of the abandonment of FGM/C into development programmes/projects
5. To recognise the importance of research, monitoring and evaluation for programmes/projects in the field of FGM/C
7. To understand the role that legal and policy measures can play in the framework of development interventions to stop FGM/C

STRUCTURE OF THE COURSE:

MODULE 1

Introduction

MODULE 2

Gender, and gender planning

MODULE 3

Understanding FGM/C in changing society

MODULE 4

Decision making processes and women empowerment

MODULE 5

Mainstreaming FGM/C prevention in development projects

MODULE 6

Building blocks for programming

MODULE 2

2

GENDER AND FGM/C

Module objective:

- To have a common understanding of the concept of 'gender' and related terms (gender equity, gender analysis, gender planning), and how they relate to FGM/C.

Why this module?

The module builds a common understanding of how gender relations are constructed, maintained, and reinforced. It further increases sensitivity to a broad range of gender issues at personal, interpersonal, institutional and community levels by bringing out traditional and modern cultural assumptions and the impact they have on both men and women. It is of vital importance to address gender inequities because of the impact these have had on women's and men's health.

The module identifies the social, cultural, economic, and political factors which impact on gender relations and the fact that FGM/C is a gender issue. Before undertaking any programming, it is essential to understand the nature of the problem. Without understanding the causes of a problem, it is not possible to target interventions appropriately.

For this reason, the first module of this course aims to build the ability of participants to undertake a gender analysis, to understand the rationale behind gender planning and how this relates to FGM/C.

Activities:

Activity 1: Differentiating sex from gender (1 hours)

Activity 2: Division of labour (1 hour)

Activity 3: Access to and control of resources (1 hour)

Activity 4: FGM/C and sexual and reproductive rights
(1 hour)

Total time: 4 hours

Activity 1

2

DIFFERENTIATING BETWEEN SEX AND GENDER

Time: 1 hour

Why do this activity?

This activity defines the concepts of sex and gender. The process helps participants to conceptualise and understand that there are two kinds of differences between women and men, namely sex and gender. Sex is physical, biological difference between women and men. Gender is not physical; gender refers to the expectations society has of people because they are female or male. While women and men's biological systems are different, and particularly their reproductive systems, many ideas about women's role in society have been shaped by culture so that many functions related to childcare and domestic work generally have come to be seen as 'women's work'. In addition, they have been given a lower value in society than work done by men. This is part of a broader ideological process in which men are given a higher social value than women - as reflected in many societies' preference for boy children. There are many and diverse ways in which this poorer valuation of women impacts on their health and on health service provision. However, before considering these, participants need an understanding and ability to analyse where biology ends and society begins. This activity aims to achieve this objective.

Objectives

- To understand which differences between women and men can be explained on the basis of 'biology or 'sex' differences
- To understand which differences between women and men are based on social values or 'gender norms'
- To recognise that norms and values which are socially constructed can be changed

How to do the activity

Step 1: 20 minutes

Ask the group if they have heard of the words 'sex' and 'gender'. Give a simple definition of each: Sex refers to the biological differences between men and women; Gender refers to the way that society expects men and women to behave. Write each of these definitions on the top of separate sheets of flipchart paper and put them on the wall.

Plenary

General statements about women and men.

Handout

Ask participants to read the ten statements and to write 'S' against those statements that they think refer to sex and 'G' against those that refer to gender. For example, the statement 'Women suffer from menstrual pains, men do not' is an 'S' statement, because women are born with wombs and men do not have wombs, therefore they don't menstruate.

Ask participants randomly or one after the other to read the statements aloud and define it as an "S" for "sex" statement or as a "G" for "gender" statement. Then check with the rest of the group: how many have chosen "S", how many "G", and why? try to reach a consensus, bearing in mind that for some statements both "S" and "G" apply.

Talk about each statement as you go along, asking people to motivate why they think this is a sex or gender statement. Push the group to reach consensus on whether this is a 'sex' or 'gender' statement. This process helps to draw out all of the complexities of the issue. Write the statements up on the flipchart under the appropriate definition as you go along. It is possible that the participants will conclude that some statements are both sex and gender- if so write them so they straddle both pieces of paper.

Plenary discussion

Statements 1, 4 and 6 are 'S', the rest are 'G'.

Step 2: 20 minutes

Now the group moves to how 'sex' and 'gender' link to health issues. Distribute Handout: Health-related statements about women and men. Again people are asked to mark the handouts as either 'S' or 'G' and again you distribute them and read out the questions, getting the group to indicate how people understood the statements. Through group discussion develop a group consensus and again list the statements on the appropriate sheet as statements that refer to either sex or gender. In this case statements 2, 3, 8 are 'S'; Statement 5, 7 are both 'S' and 'G', the rest are 'G'.

Handout

Step 3: 20 minutes

Consolidate the activity by using the overhead 'Sex and Gender' to help participants develop a clear understanding about the difference between sex and gender, or use the flipchart definitions you already have up. This section will also give them a deeper understanding of the concept of gender. While running this discussion, draw on the examples given by participants during activity 1. These examples will

Plenary

allow you to illustrate the different characteristics of gender. You can do this as follows:

Cover up the bottom part of the overhead, so that participants can only see the definitions of gender and of sex. Tell them that what they have done in the previous two exercises is to define the difference between sex and gender. They saw that there are very few characteristics that are biologically determined; most are socially constructed. You will now try to unpack the different characteristics of 'gender' based on the previous discussions.

Now show overhead 2 so that you show one concept at a time, starting with 'Relational'. Explain the word to participants, using the explanations in the box below. Give an example from the stories participants told in Activity 1. Then ask the participants to give their own examples of how gender manifests in that characteristic. For example, under 'historical', participants may point out that whereas in the past women were expected to do all the cooking, over time men have started to cook too; or that before the revolution girls were not sent to school whereas now they are - these are changes over time and illustrate that gender roles are historically specific. Go through each of the characteristics on the overhead one at a time in this way.

Note to facilitator

The following are characteristics of gender

Definition: Gender refers to the way that the society expects men and women to behave. Sex refers to the biological differences between men and women.

Relational: It is relational because it refers not to women or men in isolation, but to the relationships between them and how these relationships are socially constructed.

Hierarchical: It is hierarchical because the differences established between women and men, far from being neutral, tend to attribute greater importance and value to the characteristics and activities associated with what is masculine and to produce unequal power relations.

Historical: It is historical because it is nurtured by factors that change over time and space and thus can be modified through interventions.

Context specific: It has contextual specificity because there are variations in gender relations depending on ethnic groups, class, culture etc. It is therefore necessary to recognise diversity in the analysis of gender relations.

Institutional: It is institutionally structured because it refers not only to the relations between men and women at the personal level, but also within social institutions such as schools or health systems and in the overall social system that is supported by values, religion, , legislation, etc.

Gender relationships are personal and political: Personal, because gender roles that we have internalised define who we are, what we do and how we think of ourselves. Political, because gender roles and norms are maintained and promoted by social institutions and challenging these implies challenging the way society is currently organised. Indicate to them that in the next session you will be exploring how gender relationships have to do with access to and control of and over resources and benefits.

Materials:

- Flipchart, and overhead transparency.
- Copies of the Handouts for each person.
- Two sheets of flipchart paper with the simple definitions of sex and gender written at the top.

Overheads:

SEX OR GENDER? - GENERAL STATEMENTS

Read the statements and write 'S' against those that you think refer to sex and 'G' against those that refer to gender.

1. Women give birth to babies, men do not.
2. Little girls are gentle, boys are rough.
3. Amongst African agricultural workers, women are paid 40-60 per cent of male wages.
4. Women can breast-feed babies, men can bottle-feed babies.
5. In Ancient Egypt men stayed at home and did the weaving. Women handled family business. Women inherited property, men did not.
6. Men's voices break at puberty, women's do not.
7. According to the United Nations, women do 67% of the world's work, yet their earnings for it amount to only 10% of the world's income.
8. 2 million girls are mutilated every year.
9. In one study of 224 cultures, there were five in which men did all the cooking and 36 in which women did all the house building.
10. Girls cannot ride bicycles, boys can.

Williams, S., Seed, J. and Mwau, A., *The Gender Training Manual*, Oxford, Oxfam, 1994: 87-89.

SEX OR GENDER? - HEALTH- RELATED STATEMENTS

Read the statements and write 'S' against those that you think refer to sex and 'G' against those that refer to gender

1. The majority of hospital managers in most countries are men and most of the ward managers are women.
2. Boys and men suffer from haemophilia, whereas girls and women are usually only carriers.
3. Women suffer from pre-menstrual tension, men do not.
4. More health research funds go to research on men than on women.
5. Women are more susceptible to sexually transmitted diseases than men.
6. When infertility occurs in a couple, it is often presumed to be the fault of the woman.
7. The rates of behaviour disorder and hyperactivity for boys is 2-3 times the rates for girls.
8. Women have ovary cancer, men have prostate cancer.
9. Infibulated women suffer from menstrual blood retention.
10. In deprived rural areas girls suffer from malnutrition more than boys.

Xaba, M. and Varkey, S., *Women's Health Project Gender and Health Course: Facilitator's Guide. Women's Health Project. School of Public Health. University of the Witwatersrand. Johannesburg 2000.*

Activity 2

2

DIVISION OF LABOUR

Time: 1 hour

Why do this activity?

The concept of 'gender' is complex. The following activities deepen participants' understanding of the concept of 'gender'. This activity provides them with tools for gender analysis, to understand the concepts of 'division of labour' and 'gender roles'. The ability to analyse the division of labour in a specific social context, including differences in payment between men and women, is a central building block for gender analysis. It allows participants to see that women's work and men's work are differently valued. The underevaluation of women's work is one aspect of women's overall lower social status. The failure of men to share in domestic work means that women often work extremely long hours, especially where they are also engaged in wage work or agricultural activities. The activity allows participants to identify how women's domestic roles give them an unequal and stressful burden to carry which may have negative implications for their health.

Objectives

- To identify the different roles that men and women play
- To identify the different values associated with these roles
- To be able to use the concepts of 'division of labour' and 'gender roles'

How to do the activity

Step 1: 30 minutes

Handout Distribute Handout: The 24-hour day.

Ask the participants to form groups of about 4 - 6 people. Each group should choose one social group of which they have personal knowledge - such groups may be farmers, poor town dwellers, middle class where both husband and wife work, etc. Ensure that each group has chosen a different social group.

Ask the group to imagine a typical day in the lives of a wife and husband from the social group they have chosen.

Using the framework provided in the handout, ask the group to list the tasks performed by the wife and husband in a household over 24 hours on a sheet of flipchart paper. The participants need to fill in the activity the person is doing at the time indicated, whether it is paid work, and what the pay is per hour.

Once they have filled in the table, they need to calculate the number of hours each person works, and the total pay they receive per day. Put the tables from all the groups on the wall.

Step 2: 10 minutes

Walk around the room with participants and make a note of common points from the charts on the wall.

Step 3: 10 minutes

Bring the groups to plenary. Using the questions below, draw out the common points from the tables.

1. What was your first impression when you saw the woman's and the man's chart?
2. What differences do you notice in the way in which men and women spend their day?
3. What differences do you notice in the way in which men and women spend their spare time?
4. What do you notice about what work is paid and what work is not paid?
5. What are the consequences of this for men's and women's income?
6. What are some of the consequences of these differences for women's health?
7. What are some of the consequences of these differences for men's health?
8. What are some of the consequences for society?
9. Discuss factors that could distribute the workload more evenly and how to address any other imbalances.

The sort of points that may come out are:

- Women and men do different things during the day.
- Women usually work longer hours.

Small group work

Plenary discussion

- Men usually have more leisure time.
- Women have more varied tasks, sometimes doing more than one thing at a time.
- Even when women work outside the home, they also do a substantial amount of household work as well.
- Men's work is usually outside the home.
- More of women's work is unpaid compared to men's work.
- Women are usually paid less money than men for the paid work that they do.

Main points

Main conclusions to draw out

In concluding this section, you should introduce participants to the concept of the 'division of labour'. This refers to the different socially constructed roles of men and women. Thus women taking responsibility for cooking, and men for cattle, is an example of a 'division of labour' which is normative in many societies. The different tasks that are considered 'men's work' and 'women's work' are called 'gender roles'. Girls are raised expecting to perform such gender roles as cleaning the house, while boys are raised expecting to perform such gender roles as fixing cars or looking after cattle. In contemporary society, people often make the distinction between 'productive' and 'reproductive' roles. 'Productive' work refers to work which is outside of the home and contributes to the economy; 'Reproductive' work refers to work which allows people to grow up and contribute to the economy. This means not only the work to raise children, but the daily work of cooking, cleaning, ironing and the like which are necessary to allow workers to go out each day to produce. While increasingly women do productive work as men do, they still take most responsibility for reproductive work.

The division of labour into gender roles is not only about differences between what society expects men and women to do. It is about the social understanding of the value of the roles that women and men play.

The division of labour between women and men in most cultures is unequal; gender roles are not equally valued. Men's roles are considered more important than women's roles. This is reflected in that many of women's roles are not paid for and that even in the workplace, women's work tends to be paid less than men's work. Thus gender roles are a part of the overall cultural values of a society and hence one aspect of gender norms.

The long hours that women work, and the lack of recognition of the value of this work can undermine both women's physical and mental health.

This suggests that it is time for men to start sharing reproductive work, that is domestic tasks and care of children, with women.

Draw out that the division of labour between women and men in most cultures is unequal, such that women's excessive workload has a negative impact on their health. That is, unequal gender roles are damaging to women's health.

Step 4: 5 minutes

Give out Handout: The lie of the land

Ask one participant to read the cartoon.

The purpose of this cartoon is to illustrate that researchers, women themselves and men - all members of society - often fail to see that domestic labour 'Reproductive work' constitutes work.

**Handout
Action**

Step 5: 5 minutes

Give out Handout: "Working Women". Allow time for participants to read it.

Handout

Materials:

- Flipchart paper.
- Felt-tip pens.
- Something to stick pieces of paper to the wall with.
- Copies of Handouts for each participant.

Handouts:

- Handout 1: The 24-hour day
- Handout 2: The lie of the land
- Handout 3: Working Women

WORKING WOMEN

WOMEN AND GIRLS ARE KENYA'S BREADWINNERS

- Women in rural Kenya work on average about 56 hours a week, men only about 42. Children between the age of 8 and 16 also work many hours. If time spent for education is counted, girls spend about 41 hours a week in economic activity, boys 35 hours.

- Women shoulder the heaviest burden in household work, including firewood and water collection: 10 times the hours of men. This carries over to girls, whose household work takes about 3.7 times the hours of boys.

- Women in households that farm such cash crops as tea and coffee work the most of any rural women - 62 total hours a week. As Kenya's farming becomes more cash-oriented, women tend to shoulder more work, not less.

Source: Githinji 1995, as quoted in UNDP, Human Development Report 1995, Box 4.1, Page 92

MORE PAID WORK DOESN'T REDUCE UNPAID WORK

- Bangladesh had one of the largest increases in the share of women participation in the labour force- from 5% in 1965 to 42% in 1995. This has been important for export growth, with women as the main workers in the garment industry. But women still spend many hours in unpaid work. A survey of men and women in formal urban manufacturing activities shows that women put in on average 31 hours a week in unpaid work- cooking, looking after children, collecting fuel, food and water. They spend 56 hours in paid employment. Men spend an average of 14 hours a week of unpaid activities such as house repair, and 53 hours of paid employment. Thus women in formal sector employment work an average of 87 hours a week, as compared to 67 hours a week by men.

- In OECD countries men's contribution to unpaid work has been increasing. But a woman who works full time still does a lot of unpaid work. Once she has a child, she can expect to devote 3.3 more hours a day in unpaid household work. Married women who are employed and have children under 15 carry the heaviest work burden- almost 11 hours a day.

Activity 3

2

ACCESS AND CONTROL OVER RESOURCES

Time: 1 hour

Why do this activity?

This activity identifies how men and women, having different roles, have differential access to resources - whether economic, political / decision-making, informational, internal, or of time. It unravels how different types of resources, as a result of gender norms in society, are distributed in favour of men, and thereby limit women's ability to develop to their full potential, and in many cases actually undermines women's health. This tool, linked with division of labour from the previous exercise, is necessary in order to build participants' ability to identify the diverse dimensions of gender inequality underlying health problems and health services that they want to address.

Objectives

- To describe the range of resources which people use
- To identify the different impact of having access to a resource as opposed to control over a resource
- To identify the patterns of women and men's access to and control over resources in their country and community

How to do this activity

Step 1: 5 minutes

Handout You should have decided what roles you want participants to play - see Handout: Role play.

Ask for two people, preferably a man and a woman, to volunteer to do a role play. Take them to one side and give each of them their role and ask them to think about how they will play this role. Do not let the other participants see the roles. Tell the actors that they will have about 5 minutes for the role play.

Then tell the group that they will be watching a role play. Remind them that a role play is when participants act different parts. They are not presenting their own views, but the roles that they have been asked to play.

Step 2: 10 minutes

Ask the actors to perform the role play. Do not allow them more than 5 minutes.

Ask the actor playing the woman:

‘How did you feel playing this role?’ and let her respond.

Ask the actor playing the man:

‘How did you feel playing this role?’ and let her respond.

Ask the group:

‘Is this a real situation? Do things like this happen?’ and let them respond.

Run a short plenary discussion asking the group:

‘In the role play, what resources were being contested?’

Draw out from the role play which resources the man has control over and which, if any, the woman has control over. At this point the participants may not be familiar with the language of ‘access and control’ which you will introduce in the next step, so keep the points simple. The sorts of points which may come out of the role play include:

The woman had access to the land. It was her husband’s land. However, she did not have the right to ownership or control over the vegetables she grew on the land. Although she usually sold the vegetables and kept the money, her husband had the right to sell them and keep the money if he wanted to because he owned the land.

Also gender norms in their community were that men had control over decision-making in the home. So the man had the right to decide what to do with money from the sold vegetables.

The man had access to information about where to get good prices for vegetables which the woman may not have had since she was based at home and did not move around as the man did.

Step 3: 40 minutes

The issues which came up in the role-play give you an entry point for this step, which is a more formal process of guiding participants though understanding one of the central reasons why the social construction of gender is about discrimination rather than just difference.

Begin by discussing the meanings of ‘access’ and ‘control’ and why having access to a resource is different from controlling it.

Note to facilitator

Main points

Overhead Put up Overhead: Relationship between control over resources and power.

Definitions

Access is the ability to use a resource.

Control is the ability to make binding decisions about the use of a resource.

The distinction between access to and control of certain resources is important because the ability to use a resource does not necessarily imply the ability to make decisions about the use of that same resource. For example, a woman may use land to grow food on. But the land may belong to her husband who decides whether to keep or sell the land, and who owns the products of his wife's agricultural work from that land. A woman may have access to a donkey for transport, but if she does not decide who can use the donkey when, then she does not have control over it. If, for example, she needs to go to a clinic using the donkey, but her father-in-law who owns the donkey wants to use it to go to visit friends, then the woman's needs may be ignored - thus she has access to the donkey, but not control over its use.

Indicate that the fact that women and men are socially assigned different roles and responsibilities (the division of labour between women and men) has direct implications for the level of access to and control over resources they have, which in turn affects their health and their ability to access health services.

Overhead Use this overhead to make the point that people who control resources have greater power in society than those who do not. Indicate that one feature of the gendered division of labour is that different roles are associated with differential access to and control over resources. It is predominantly men who have control of most resources, and women who do not, although the actual way this works differs between societies.

These overall resources include those necessary for the promotion and protection of one's health as well as the health of others.

Go on to look at the different types of resources - give participants handout: Range of resources. Alternatively or in addition you can use the overhead provided.

Handout Take participants through each dimension of the handout, leaving time for them to give examples of the different types of resources which are at stake.

The capacity to have access to and control over resources develops and strengthens internal resources that can enhance personal development; hence these resources have been included.

Examples of how access to, or control over resources might impact on health

Economic resources

A woman may have access to funds through her husband who earns a wage or sells the household's agricultural products for money. However, if it is her husband who decides if she can have the money she wants, then she does not have control over this resource. This means that if she wants to go to a clinic, but there are fees for services, then her husband and mother in law determine her access to health care, or to transport to get there even if services are free.

A woman may have the right to live (access) in a house which belongs to her father, husband or son. However, in many situations women are legal minors. When the man who owns the house dies, the woman does not inherit. Her right to continue living in the house depends on the man who inherits. Thus she does not control her own security in relation to her home.

It is not only women who may have lesser control over economic resources. Age may determine when a man gains control over resources; class determines the quantity of economic resources that some men can access and control, in comparison to other men. Workers, for example, usually do not own the factories where they work, hence they have access to a means of earning income, but they do not control that means of earning income. Amongst daily workers, however, it is usually women who earn least income, since 'women's work' is given less value in society than 'men's work'.

Political / decision-making resources

Women tend to have less access to political resources, such as the opportunity to stand for parliament. Women also have less access to control over decision-making about who goes to parliament. Most political parties are dominated by men at leadership level, thus it is men who will decide whether or not a woman can stand to be elected for parliament.

This applies likewise to decision-making positions in private sector companies, in trade unions. In all cases the leadership tend to be men and it is they who control decision-making.

Control over decision-making determines priorities in any institution: those who control local government may determine whether money should be spent on outreach from health centres or on a new sports field. If there are few women in decision-making positions, women's needs and priorities may not be heard. However, gender is not the only determinant of who controls decision-making resources. National leadership tend to be urban so that rural people in general have less control over political decision-making; rural women even less so.

The right to make decisions within the home is also a resource. In most homes, men have control over decisions about how the household's income will be spent; and how the women and children will behave.

Note to facilitator

Information / education

Women often have less access to information and education than men. For example, in most parts of the world boys have substantially greater access to education than girls; in countries where many men are migrant workers, they may have greater access to information from newspapers than women in rural areas.

Given decision-making roles within the household, it is usually not women who control decision-making about their children's access to education and whether girls will have the same educational opportunities as boys; or about what sorts of information comes into the household - whether money is spent on TV or radio or newspapers.

Decisions about which radio stations are listened to or which TV programmes are watched, are also often controlled by men, when both men and women are in the household. This may influence women's access to satisfying recreation or information such as about political processes and opportunities for participation, or skills training provided through the media. Women's lesser access to the internet, the fastest growing information resource, compounds their marginalisation.

Who has control over information? Production of information is one of the most powerful positions in society. Most of these positions are held by men. Likewise in governments or NGOs which play educational roles, one needs to know who is deciding what information the public needs, and how to communicate that information? Are they aware that women and men of different ages may have different health information needs? Do they use their control over media to ensure messages which promote equity/equality between women and men, or do they use their power to reinforce existing gender norms?

Time

Time is a resource in so far as one can make choices about how to use it. The previous activities on the division of labour between men and women showed the unequal allocation of time spent on work (in addition to the problem that women's labour in the home is not given any monetary value). In addition, time is not elastic - there are only so many hours in a day. If all of these hours are spent on work, this means there is less time for leisure, for further education, or for community activity. Thus women's lack of control over time further limits their options in life.

Control over time also arises in relation, for example, to access to health services. If a person has little time, they are not likely to use up time in making use of health services. Also, the opening times of a health service may determine whether or not a health service can meet various groups' needs. For example, if men or women are employed in the formal workforce, and the clinic is only open during the hours at which they are at work, then they will not be able to access the clinic, unless their workplace allows them control over their time - to work flexible hours, for example, so they can access a health centre.

Internal resources

Discrimination can undermine a person's sense of their own value. For example, if a woman does not have control over her own body - if the gender norms are such that she cannot decide when to have a child -

the feeling of worthlessness can make it hard for her to take control over other dimensions of her life. If a woman or a child is beaten up by her husband or other family members, this reinforces society's view that she is of little value and does not need protection. This undermines her ability to act, rather than being permanently acted upon by others. Thus a sense of self-esteem, of value and of confidence are crucial resources to allow a person to take advantage of what opportunities there may be for personal development.

Even in a context where a person has little control over any of the above resources, if she has a sense of her own value, she is more likely to get involved in group activities, such as a women's group, which could further build her ability to take control over her life.

Step 4: 5 minutes

Distribute the Handout: 'Differential access to and control of resources between men and women in selected African countries'.

Handout

Tell participants that the issues identified in the role play and through this activity's discussions are similar all over the world. The overhead illustrates differences in access to and control over resources between a number of countries. This shows that the problem is not peculiar to specific countries.

Materials:

- Copies of Handouts for each person.

Overheads:

- Overhead 1: Relationship between control over resources and power

Handouts:

- Handout 1: Differential access to and control of resources between men and women in selected Asian countries
- Handout 2: Range of resources
- Handout 3: Role-play on access to and control over resources gives you some roles for volunteer actors to play. Decide if you want to use this role-play or to make

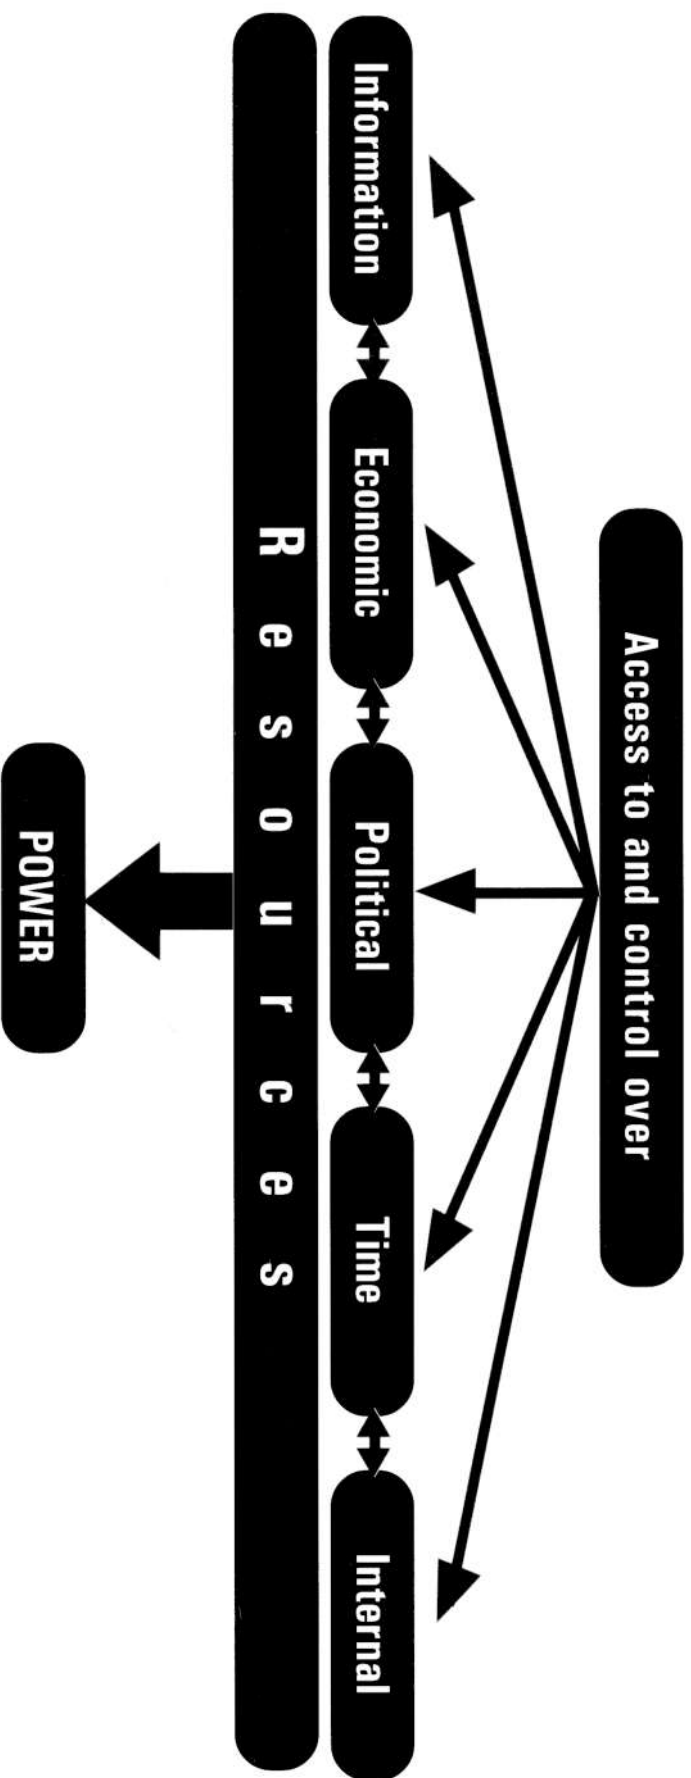

different roles so that the role play will give you examples and issues you can use when describing the different kinds of roles and resources in society. The role play should also illustrate men and women's differential access to and control over these resources. You do not make copies of the handout for participants. You just give each volunteer a copy of his or her role.

RANGE OF RESOURCES

Economic Resources

- Remunerative Work
- Credit
- Money

Basic Needs

- Food
- Housing
- Transportation

Services

- Child care facilities
- Health services
- Social security, health insurance
- Facilities to carry out domestic tasks

Technical

- Technology
- Equipment
- Skills training

Political Resources

- Positions of leadership and mobilisation of actors in decision-making positions
- Opportunities for communication, negotiation and consensus-building

Information/Education

- Inputs to be able to make decisions to modify or change a situation, condition or problem
- Formal and informal education
- Non-formal education
- Opportunities to exchange information and opinions

Time

- Hours of the day available for discretionary use
- Flexible paid hours

Internal Resources

- Self-esteem
- Self-confidence
- The ability to express one's own interests

Women, Health and Development, Workshop on Gender, Health and Development, Washington D.C. Pan American Health Organisation, 1997: 45

ROLE PLAY ON ACCESS TO AND CONTROL OVER RESOURCES

Role 1:

You are a woman. You work on your husband's lands growing vegetables for the family to eat. Your husband does not work on the land. He works in the village. Your family eats some of the vegetables and the rest you sell at the market and this gives you some spending money. Otherwise you have no money of your own. Your husband does not give you money, he simply brings food and other necessities from the village. You need to have some money available, so that you can buy small things for your children or for yourself, or pay for the clinic when you need to go. Your husband comes home and tells you that a friend of his has offered to sell your vegetable crop in a bigger town.

Role 2:

You are a man. You have a job in the village. Your wife grows vegetables. A friend of yours has offered to sell the vegetables in a bigger town for good money. You want to do this because you need more money to buy a gift for your best friend's wedding.

Activity 4

2

FGM/C AND SEXUAL AND REPRODUCTIVE RIGHTS

Time: 1 hour

Why do this activity?

Talking about sexual and reproductive health and rights is, sometimes, a source of misunderstanding especially in some communities where many body's needs are considered taboos. Understanding the meaning of sexual right or reproductive rights is the first step to gender equality.

Sexuality is a central part of human experience and should contribute towards our sense of well-being, and towards strengthening our intimate relationships. However, inequalities between men and women in sexual decision-making frequently undermine the quality of sexual relationships, and at worst put women in danger of ill-health, and indeed, of death. But both men and women, can be endangered by the inability of individuals to communicate openly about sex and sexuality. Inequality between sexual partners can also put the partner with less power - usually women - into a position where they are afraid to talk to their partners - for example to discuss with their partners the need to practice safe sex.

At the Fourth World Conference on Women held in Beijing in 1995, the international community asserted that:

“The human rights of women include their right to have control over and decide freely and responsibly on matters related to their sexuality, including sexual and reproductive health, free of coercion, discrimination and violence. Equal relationships between women and men in matters of sexual relations and reproduction, including full respect for the integrity of the person, require mutual respect, consent and shared responsibility for sexual behaviour and its consequences (par. 96)”

This position is frequently referred to as 'sexual rights' although the actual words 'sexual rights' are not in the Beijing Platform.

Many NGOs are more familiar with the concept of 'reproductive rights' than 'sexual rights' in fact the international community, through the United Nations has agreed on a concept of reproductive rights which all countries should try to ensure for their citizens and define it as well as possible. This concept is in both the ICPD Programme of Action and the FWCW Platform of Action.

An infringement of those rights is the practice of FMG/C, that is the expression of gender inequality and the cause of some sexual and reproductive diseases, sometime of death consequences.

Objectives

- To distinguish between reproductive rights and sexual rights
- To understand why FGM/C is a violation of sexual and reproductive rights

How to do the activity:

Step 1: 10 minutes

Distribute to the participants the Handout 1 “Reproductive Rights and Sexual Rights” which provides the definition of Reproductive rights and Sexual rights. Give them 10 minutes to read it individually and underline the most relevant concepts. The time indicated is more then the participators need.

Handout

Step 2: 40 minutes

Ask the participants the questions in the Note to the facilitator and have a short discussion in plenary after each question following the related indications. You have to verify if the participants have understood the difference between Reproductive rights and Sexual rights and why the practice of FGM/C is a violation of these rights.

Plenary

Step 3: 10 minutes

Use the Handout 2 to open a plenary discussion on “Who does my body belongs to?”. People has to answer at the following question: “Does my body belongs to my husband? Does my body belongs to my doctor? Does my body belongs to my boss? Does my body belongs to the government? Does my body belongs to my religion? Does my body belongs to me?” This short discussion is used to verify if the message that a woman's body belongs to herself has got through.

Plenary

Ask to the participant the following questions and have a short discussion.

**Note to
facilitator**

Plenary

1. Why is the issue of freedom from 'discrimination, coercion and violence' central to the concept of reproductive rights?

For many people sexual relations are associated with violence. Rape in marriage, for example, is not recognised by all countries as a violation. Amongst young people in some countries, there is little clarity amongst young men about what constitutes choice - if a young woman says she does not want sexual intercourse, the young man may not believe her, and may push her into intercourse anyway. Incest is another major problem facing both young boys and girls. All of these situations, while in the first instances breaches of 'sexual rights' may also lead women to become pregnant, in which case they are also breaches of women's reproductive rights. The concept of reproductive rights is intended to cover all of these situations, emphasising that women should never become pregnant against their will or without having had the opportunity to make a decision as to whether or not they want and are able to take responsibility for a child.

Questions

2. Why are 'mutually respectful and equitable gender relations' a prerequisite for reproductive rights?

Reproduction usually results from sexual relations between men and women. Without mutual respect between them, there may not be the possibility of open communication about each of their reproductive desires, and about the implications of having or not having a child for each of them as well as for any children they may already have, and for any other family members for whom they may be responsible. The impact of having children is usually very different for women than for men. There are health implications for the woman, and mutual respect is required for the man to play a role in ensuring as little negative health impact as possible on the woman. A woman's husband or partner should ensure that she has enough food; that she has access to health services; that she does not carry out any work that may endanger her health during pregnancy etc. In addition, having a child raises the question of who will undertake childcare, both earning the necessary funds and looking after the child on a daily basis. This should be the responsibility of both the man and woman, and mutual respect and equitable gender relations are necessary for them to be able to openly discuss the best ways of meeting the child's needs, such that burdens and benefits are equitably shared between them.

3. What is the meaning of sexuality?

Sexuality refers to the expression of sexual sensation and related intimacy between human beings, as well as the expression of identity through sex and as influenced by or based on sex. Sexuality is a central part of human experience and should contribute towards our sense of well-being, and towards strengthening our intimate relationships. However, inequalities between men and women in sexual decision-making frequently undermine the quality of sexual relationships, and at worst put women in danger of ill-health, and indeed, of death.

4. Why are sexual rights different from reproductive rights?

Whereas reproductive rights concern the right of people to choose if, when and how many children to have, sexual rights are relevant at all times of people's lives, at all ages, since children can suffer sexual abuse, and people are sexually active into old age, when they are no longer concerned with childbearing.

You have to facilitate the understanding of the difference and the link between.

5. What do you think that a sexual rights approach is aiming to achieve? and reproductive rights approach?

The sexual rights approach is aiming to identify how gender inequality makes sexual relationships dangerous for women, since they become

vulnerable to abuse and disease. The reproductive rights approach is aiming to achieve women to be free to decide whether or they want and are able to give birth and take the responsibility for a child and as the sexual rights to fight against gender discrimination, coercion and violation. The two kinds of rights argue, in the relative sectors, the promotion of gender equality and that women and men can have control over their bodies, sexuality and family planning. The approaches aim to involve both decision-makers and people at community level in building a culture of sexual rights and reproductive rights at the individual level and in social institutions such as the education, justice and health systems.

6. What are the barriers to promoting sexual and reproductive rights at community level?

In identifying barriers to promote sexual rights, consider barriers at the individual level (such as women's own sense of self, their confidence etc. and men's sense of how they should behave sexually in order to meet their own expectations of masculinity) as well as social barriers, such as cultural assumptions about how men and women should behave sexually cultural taboos. Also consider institutional barriers such as whether there is legislation against sexual violence against women, whether there is sex education in the school curricula etc.

Reproductive rights faces against social and institutional barriers (sometimes governmental) in which man is considered the only one who can take decision on reproductive health including family planning. Also consider social barrier when the respectful for a woman depends on the number of her children, maternity gives her a role in the community.

7. What could your organisation do to promote sexual rights or/and reproductive rights?

Organisations can commit to incorporating the concept of sexual rights or/and reproductive rights in the work they currently do. Organisations can do advocacy for government to change laws and policies so that they are in keeping with international agreements. They can do advocacy for governments to implement existing policies. Organisations can build community awareness of the concept of sexual rights and build the capacity of women and men to protect their own sexual rights and act responsibly towards their sexual partners or/and build community awareness of the concept of reproductive rights especially related to maternity, family planning, sharing responsibility. Organisations can offer health services which promote sexual or/and reproductive rights.

8. In which respect FGM/C violates the reproductive rights of women?

Reproductive rights are not only the rights not to have a child if you do not want to, but also to have a child if you want to. FGM/C can cause infertility, which prevents a woman from having the desired children and is very often the cause for her husband divorcing her, with all the negative effects on her life. FGM/C causes difficulties in intercourse, pregnancy and delivery. FGM/C are usually the cause of reproductive and sexual illness with consequences on women sexuality, sexual experiences, health, maternal mortality, infant mortality, ect.

You have to facilitate the understanding of the violation of these rights by the FGM/C practice

9. Do you think that FGM/C represents a violation of the sexual rights of women?

Yes: cutting the clitoris is done for the purpose of diminishing sexual pleasure/activity of women, therefore represents a violation of their right to enjoy sexual life as naturally inscribed in their bodies.

10. Which are the health consequences of FGM/C?

There is reliable evidence connecting FGM to obstetric complications. Who' study on the Female genital mutilation and obstetric outcome in six African Countries Burkina Faso, Ghana, Kenya, Nigeria, Senegal and

Plenary

Questions

Plenary Questions

Sudan involved 28,393 women at 28 obstetric centres study shows that women who have had FGM are significantly more likely to experience difficulties during childbirth and their babies are more likely to die as a result of the practice. Serious complications during childbirth include the need to have a caesarean section, dangerously heavy bleeding after the birth of the baby and prolonged hospitalization following the birth. The study shows that the degree of complications increase according to the extent and severity of FGM.

11. What could your organization do to promote the abandonment of FGM/C practice?

Organisations can commit to incorporating the concept of the practice of FGM/C is a violation of sexual and reproductive rights in the work they currently do. Organisations can do advocacy for government to change laws and policies so that they are in keeping with international agreements. They can do advocacy for governments to implement existing policies. Organisations can work with the women' and community-based organizations to identify and elaborate campaign for the sensitization and information on FGM/C related to sexual and reproductive rights.

REPRODUCTIVE RIGHTS & SEXUAL RIGHTS

REPRODUCTIVE RIGHTS

“Reproductive rights embrace certain human rights that are already recognised in national laws, international human rights documents and other consensus documents. These rights rest on the recognition of the basic right of all couples and individuals to decide freely and responsibly the number, spacing and timing of their children and to have the information and means to do so, and the right to attain the highest standard of sexual and reproductive health. It also includes their right to make decision concerning reproduction free from discrimination, coercion and violence, as expressed in human rights documents. In the exercise of this right they should take into account the needs of their living and future children and their responsibilities towards the community. The promotion of the responsible exercise of these rights for all people should be the fundamental basis for government and community supported policies and programmes in the area of reproductive health, including family planning. As part of their commitment, full attention should be given to the promotion of mutually respectful and equitable gender relations and particularly to meeting the educational and service needs of adolescents to enable them to deal in a positive and responsible way with their sexuality. Reproductive health eludes many of the world’s people because of such factors as: inadequate levels of knowledge about human sexuality and inappropriate or poor quality reproductive health information and services; the prevalence of high risk sexual behaviour; discriminatory social practices; negative attitudes towards women and girls; and the limited power many women and girls have over their sexual and reproductive lives. Adolescents are particularly vulnerable because of their lack of information and access to relevant services in most countries. Older women and men have different reproductive and sexual health issues which are often inadequately addressed”.

Source: *ICPD PoA, paragraph 7.3 and repeated in the Fourth World Conference on Women Platform of Action, Beijing, 1995, paragraph 95.*

SEXUAL RIGHTS

“The human rights of women include their rights to have control over and decide freely and responsibility on matters related to their sexuality, including sexual and reproductive health, free of coercion, discrimination and violence. Equal relationship between women and men in matters of sexual relations and reproduction, including full respect for the integrity of the person, require mutual respect, consent and shared responsibility for sexual behaviour and its consequences.”

In the concept of sexual rights there is the concept of the right to decide if, when and how to have sexual relations, and the concept of the right of women and men to control their own bodies and sexuality.

Source: *Platform of Action of the Fourth World Conference on Women, United Nation, Beijing 1995: par. 96*

MODULE 3

UNDERSTANDING FGM/C IN CHANGING SOCIETY

Module objective:

- To define the cultural environment in which actions will take place by tracing back origins and historic evolution of FGM/C
- To understand reasons behind the practice, both "self-explained" and "real"
- To analyse the causes of persistence of the practice, at the convergence of "modernity" on "tradition"

Why this module?

In 1995 DHS - Demographic and Health Surveys (Macro International) started to collect data on FGM/C prevalence and attitudes towards prosecution and/or abolition of the practice. The results showed impressive high levels of prevalence: Egypt 97%, Guinea Conakry 99%, Mali 94%, Eritrea 90%, Burkina Faso and Ethiopia 73%. This despite in some of the surveyed countries prevention campaigns were conducted since the middle of the Eighties.

Why campaigns have been not so successful as expected, and how to better design them, has been the object of several studies and discussions among donors and UN agencies over the last 5 years.

Behind the practice there seem to be profound reasons that prevention programs need to address, in order to be successful. This module aims at understanding these reasons in order to bring that knowledge into programming.

Activities:

Activity 1: Myths and realities behind the practices (1 hours and 30 minutes)

Activity 2: Is FGM/C a religious practice? (1 hour)

Activity 3: Is FGM/C a women's affair (1 hour)

Total time: 3 hours and 30 minutes

Activity 1

3

MYTHS AND REALITIES BEHIND THE PRACTICE

Time: 1 hour and 30 minutes

Why do this activity?

This activity prompts program officers to explore the broad range of reasons, both social and cultural, for the persistence of FGM/C. As harmful as the practice might be, with immediate and late side effects that reduce girls and women's health standards over the life cycle, in particular when the worse forms are involved (FGM/C type III or infibulation, as well as type II including "sealing" as in several ethnic groups in Western Africa), and with increasing knowledge and information on these available, the practice has not stopped. Research instead is showing a progressive change, with age of performance reducing up to a few years or even a few months, an increasing involvement of health personnel in order to avoid immediate consequences such as infections and pain, and less invasive forms, such as clitoridectomy and excision (type I and II) substituting type III.

Objectives

- To understand reasons for the persistence of the practice looking at what people say about why it should be done
- To recognize the gender power dynamics lying behind justification given for performance and perpetuation of FGM/C
- To define the cultural aspects that should be addressed in mainstreaming FGM/C prevention activities into development programs and projects

How to do this activity

Buzzing

Divide the group in pairs of two, inviting each participant to talk to his/her direct neighbour.

Ask each participant to share with her/his partner one **common statement** made in his/her community and/or area to justify the practice of FGM/C. In particular each person should take maximum 10 minutes to

present the statement according to the “5 W” usually used in the lead of a news article, which means that they have to define:

WHAT is said, the statement/reason usually given in his/her respective environment to SUPPORT the practice of FGM/C and its continuation nowadays

WHY explaining why this statement is made

WHO by whom it is usually made

WHEN in which particular moment this statement is made most commonly (for ex. at during girls infancy, at puberty, before marriage...)

WHERE not only where geographically (in which particular area), but in particular of it is made at home, among friends, in the school, in the church/mosk, etc.

Remind the group that for the reporting and discussion in plenary, each participant will share with the plenary the statement made by his/her colleague. The facilitator will ring the bell when the first 10 minutes are over, in order to ensure that the second partner gets enough time to share his/her statement with his/her colleague.

Step 2: 45 minutes

Draw the table below on a flipchart.

Plenary

The plenary discussion should cover some of the following:

What ...is said	Who	Why	Where	When
.../...				

Reconvene the plenary.

Invite each participant to share with the group the *justification* for the performance/continuation of the practice given by his/her colleague, including explaining by *whom* the statement is made, *why*, *when* and *where*.

Fill the table on the flipchart as long as the different statements are shared.

Statements might include:

- Circumcised women give a higher brideprice to their families when married.
- Every human being is born with a double identity: excision is used as an instrument to define femininity, cutting off the male part.
- If not cut, a woman will not get married.
- Excised women are always in good health and rarely fall ill.

Note to facilitator

- The clitoris and the labia minora are removed to make the genitalia more beautiful.
- The clitoris will continue to grow and hang in an embarrassing way against the thighs, like the penis.
- Uncircumcised women have an excessive sexual appetite and will end up to be prostitutes.
- It confirms ethnic identity: women who are not cut will feel alienated from their communities.
- People in the community and family will not eat the food prepared by uncircumcised women.
- A man will not be able to satisfy sexually an uncircumcised woman, and she will be betray him and look for other men for sexual pleasure.
- It is a rite of passage to adulthood, to womanhood.
- It preserves virginity until marriage and chastity during marriage.
- The clitoris increases male excitation, leading to premature ejaculation.
- The vulva opening is reduced to increase male's pleasure.
- It is done to prevent *lawa lawa* (Tanzania), a disease that gives vaginal discharge.
- The cut part of the external genital are used for amulets and rituals for the miners in order to get more tanzanite (Tanzania).
- It is a tradition, and we have to respect it.
- It is requested by the traditional African religion.
- If she is not circumcised, she will not be able to attend to the animals, open the door for the cattle, or serve food to her family members.

WHO: These statements are made primarily by:

grandmothers
 mothers
 elder family members
 peers: other girls in particular
 men
 elder men
 everybody
 the community at large

Girls and young women are the main target of such statements, as these are used to make them accept to undergo the practice.

WHEN:

They are made all along the education and socialization process of girls, in order to prepare them to be “good” women. They intensify when puberty is approaching and during adolescence. Or are made before and in preparation for marriage.

WHERE:

Generally the statements are made in family settings: the family house/compound, including while visiting relatives in the rural areas. Schools and playgrounds where girls, adolescents and young girls meet provide a typical arena for peers to discuss issues linked to sexuality, boy-friends, marriage, therefore also FGM/C.

Step 3: 15 minutes

Read through the different statements and ask participants to answer to the following questions:

- Is this statement based on real facts?
- What arguments can be opposed to this statement?
- Ask one volunteer to come to the flipchart and write down the answers concerning each statement.

If needed to animate the discussion, and if time allows it, ask one in the group to take the position of a specific stakeholder in society - such as an old woman, an old man, or a young man/husband, and invite him/her to challenge the arguments from the point of view of this stakeholder, inviting everybody to consider the position of "others" when planning activities.

Real facts quoted by participants might include the following:

on identity... Gender identity is the result of socio-cultural construction that has no need for physical alteration. Culture is continuously changing and adapting over time, so that also the sense of identity, including ethnic identity, adapts to new conditions.

on sexuality... FGM/C is generally perceived and practiced to control women's sexuality. Nevertheless, sexual intercourse before marriage is common, in particular it is viewed positively for young men, as a proof of their "malehood". Stigma continues to apply only and foremost on girls.

on marriage... Families are abandoning the practice and marriages are not always organised in the traditional way, allowing for uncircumcised women to marry as well. nevertheless, bride price is still common, and the perception that FGM/C increases the bride price is widespread. Its effects go beyond FGM/C and should be addressed in an overall women's empowerment perspective.

on health... As the recent WHO study has shown, FGM/C has evident consequences on health, in particular on sexual and reproductive health, including difficulties in sexual intercourse and in delivery. Not cut women do not lead men to premature ejaculation. Glandular secretion of the vagina is natural to keep tissue smooth. If in healthy condition it does not has bad odours.

on beauty... Beauty is a matter of taste. In places where FGM/C has never been practiced other beauty criteria prevail.

on FGM/C as a rite of passage and other taboos associated with FGM/C... In rural areas FGM/C might still be considered as a rite of passage, although this is changing as more contacts are build with non practicing communities. In urban setting and where education is accessible for girls, the need for a rite of passage to adulthood is not perceived so strongly

on religion... There is no mention of circumcising women in the Koran, nor in other religious texts, although Islamic religious leader often promote clitoridectomy with or without excision of *labia minora* and oppose the activists who advocate for the total abandonment of the practice.

Traditional animistic religion often foresees FGM/C as well, and remains in the background promoting the practice despite people might have adopted another religion over time.

Traditional religion might have a role.

Note that the discussion will depend on the statements made by participants.

Explain that understanding the belief system which lies behind any

Plenary

Note to facilitator

Individual reading, last round of comments

society is essential in designing interventions aimed at changing behaviours. For this to happen, learning from and with local people and striving to appreciate their knowledge, instead of teaching them or imposing your knowledge or ideas, might be the most effective strategy. In the most cases it will become clear that FGM/C is not necessary to preserve the cultural values and practices that it is linked to.

Step 3: 30 minutes

Distribute the handout on “The realities of myths and beliefs regarding FGM/C” to participants at the end of the discussion: ask them to read it and make a last round of comments.

To finish propose to the group the following definition of culture by sociologist Ulf Hannerz:

“When you see a river from afar, it may look like a blue (or green, or brown) across a landscape; something of awesome permanence. But at the same time, “you cannot step into the same river twice”, for it is always moving, and only in this way does it achieve its durability. The same way with culture – even if you perceive a structure, it is entirely depending on an ongoing process”.

STATEMENTS AROUND FGM/C

Every human being is born with a double identity: excision is used as an instrument to define femininity, cutting off the male part.

If not cut, a woman will not get married.

Excised women are always in good health and rarely fall ill.

The clitoris and the labia minora are removed for aesthetic reasons.

The clitoris will continue to grow and hang in an embarrassing way against the thighs, like the penis.

It confirms ethnic identity: women who are not cut will feel alienated from their communities.

People in the community and family will not eat the food prepared by uncircumcised women.

It is a rite of passage to adulthood, to womanhood.

It increases the bride price.

It preserves virginity until marriage and chastity during marriage.

The clitoris increases male excitation, leading to premature ejaculation.

The vulva opening is reduced to increase male's pleasure

MYTHS AND BELIEVES TO JUSTIFY THE PRACTICE OF FGM/C

1 FGM/C contributes to gender identity

It is suggested through the myth of “twin birth” (duality of the soul) that every human being has a double identity, and that FGM/C is used as an instrument that affirms femininity or masculinity. Thus, the clitoris would be a male organ in a girl and the female organ in a man is the prepuce covering the penis. Moreover, the clitoris is perceived as an organ where evil forces may cause problems with the psyche or make a girl vulnerable to evil spirits. Because of all these magical powers attributed to the clitoris, FGM/C is conceived as a preliminary to marriage in those areas, believing that this protects the husband and progeny from the misfortunate that can assault a non-excised woman.

2 FGM/C contributes to women’s health

It is believed that women that have been submitted to FGM/C are always in good health and rarely fall ill; it is also believed that FGM/C has healing powers. It has, people say, healed women suffering from depression, from melancholy, from nymphomania, from hysteria, from madness, from epilepsy and has the ability to stop women with kleptomania tendencies. Some supporters of FGM/C believe that the secretions produced by the labia and the clitoris gland (Skene and Bartholin), produce bad odors, compromise hygiene and keep women from caring for their bodies. In those communities where washing the vulvar region with soap and water is common after relieving oneself, it is believed that the hand that washes is contaminated by the secretions and that the contamination is extended to foods, water, clothes, etc. It is therefore deemed necessary that the glands and organs responsibility for these secretions be eliminated to avoid contamination and safeguard individual cleanliness.

3 FGM/C beautifies the sexual organs of women

It is said that prepuce of the penis is removed essentially for aesthetic reasons, and that the clitoris — homologous to the penis — is removed for the same reason. In addition, in some cultures, the theory prevails that female genital organs have the capacity to develop, as with those of a man, as the body grows and that if the clitoris becomes longer, it can hang in an embarrassing way against the thighs, like the penis. Even when there is a more rational concept of the size of a clitoris, a large number of ethnic groups that consider this organ ugly to look at and indecent to touch. In their opinion a smoother female genital organ, with protuberances removed, is much more palatable.

4 It is a rite of passage for girls

FGM/C practiced in puberty in group and with a period of reclusion for the excises girls used to be, and is still true in some rural areas, an important rite of initiation for girls. The decision for FGM/C is made by the extended family (family chiefs, aunts, grandmothers or in-laws) or by local authorities (traditional chiefs, councils of elders and diviners). Girls’ initiation was a socialization of their roles as wives and mothers, and an apprenticeship of the secret rites and codes of behavior of adult females. It sometimes included a transfer of occult knowledge or professional

training. Girls in puberty submitted courageously to the torments of FGM/C and the entire collectivity rejoiced in what was known as the girls' "blessed day" and their preparation for life. It was the allowed framework to discuss and learn the details of sexuality, and the chance to create group solidarity. The greatest recompense for excised girls was acquisition of the status of adulthood and the rights that came with it with the chance to be given in marriage, while in general boys who underwent circumcision were then allowed access to the highest spheres of power and sacred knowledge.

5 Excisors play an important role in the community

Traditionally, the practice was an occupation given to specific women (*excisors*) exclusively by the community, as a sort of heritage (from mother to daughter), and by their membership in a determinant social group (for example, blacksmiths in most countries in West Africa). The prestige and social acceptance were their main reward since they worked mainly in agriculture or trade. In most cases, payment in kind and in money were symbols of a job well done and not a strategy for survival.

6 FGM/C preserves virginity before marriage and ensures fidelity during marriage

Remaining a virgin until marriage is strongly encouraged in most African societies. So much so that virginity confers a high level of prestige and, even more than the morality of the girl herself, it symbolizes the morality of her family. In the communities that practice FGM/C, people are convinced that it is very difficult for a non-excised girl to remain a virgin until marriage given the hyper-sexuality of the exterior organs of the female genital apparatus. So FGM/C, infibulation in particular, is supposed to guarantee girls' chastity. Excised girls are more capable of controlling their sexual desire, of more easily dominating themselves, and will be more inclined to remain faithful during their marriages.

7 FGM/C contributes to increase male's pleasure

According to certain social groups the clitoris is analogous to the penis and increases male excitation, leading to premature ejaculation. In these societies, when the sexual act is completed too rapidly (even though it escapes the man's control) it is considered an insult and create resentment and conflict within the marriage, It is also felt that the man should be able to control all aspects of sexual relations, from initial excitement to orgasm and ejaculation. In those types of FGM/C that call for cutting of the *labia minora* and *majora* and suture of the vulva, one of the aims is to convert the organ into a tight orifice whose size is calculated to increase male sexual pleasure.

8 FGM/C is recommended by religion, in particular Islam

There is an ambiguous relationship between affiliation to Islam and the justification of FGM/C in Africa. Some Moslems make reference to a dialogue that the Prophet Mohammed apparently had with a traditional practitioner during his lifetime to say that by excising their daughters, they are only following the Hadiths that are important elements in their religions. Indeed, in most of these country, most of the women who practice FGM/C are Moslem, which some consider a *de facto* confirmation of the relationship between Islam and FGM/C, supported by the fact that the practice is almost universal in Islamic countries such as Somalia or Egypt. Nevertheless, the contradiction is that in the countries where this is practices by a

minority (e.g. Senegal, Mauritania and Niger), most of the Moslem population does not follow this practice. Moreover, the most fundamentalist subgroups of some countries (for example, Mali and Senegal) do not practice FGM/C while some of their countrywomen submit to it, convinced that all good Moslem women must have their daughters undergo FGM/C.

Some Christians claim that they practice FGM/C while keeping with Christian tradition. They explain FGM/C with their affiliation to given ethnic groups. In contrast, the symbols and initiations that accompany FGM/C adapt easily with animist believes and the tradition of blood sacrifice to their gods or fetishes.

9 FGM/C is an essential practice for preserving ethnic identity

It is alleged that membership in an ethnic group and identification with that group requires that certain obligations be met to achieve full admission. Those adhering to the group must conform to the group's rules and regulations and defend its cultural base. The chiefs of certain ethnic groups firmly believe that non-compliance with these obligations takes away any right for members to claim the privileges and advantages they would normally be due. Most African families who want their children to be accepted by their societies and to make full use of the social rights, hold that it is very important to identify with the culture or group of their lineage. They attribute a very high value to membership in the group and the creation of ties with other children without fear of exclusion. In some communities, FGM/C is the rite that gives women this acceptability and social integration. Otherwise, they risk being separated from the group and losing their right to contribute to and participate in community life. Loss of these rights and privileges could even be extended to the head of a family where women and girls have not undergone FGM/C.

Source: AIDOS, IAC, ILO, MGF. Une question de relations entre hommes et femmes, droits humains et santé.

THE REALITY OF MYTHS AND BELIEFS BEHIND THE PRACTICE OF FGM/C:

None of the reasons advanced to justify excision have any scientific justification. From a medical point of view, modernization of the procedure (which means turning to specialized health care personnel to avoid possible infection and pain) is against medical ethics.

1 Preserving hygiene

The normal secretion of the vulvar glands are practically imperceptible—just enough to moisten the vulva area.

The expectation is at the moment of sexual arousal when secretion of the vagina increase enough to lubricate the zone and ease penetration. In addition, normal vaginal secretion is only seen in a vagina at rest (i.e. not sexually aroused) for a few days during the menstrual cycle. A “humid” period is a sign of ovulation and lubricates so that spermatozoids can swim the length of the vagina. Otherwise, the vulva is “dry”. Under normal conditions, in a health, clean female, these secretion are colorless and their odor is not disagreeable. Thick, colored, bad-smelling, continuous vaginal secretions are signs of an infection and should be treated immediately. In areas where the women are required to wash the vulva after urinating, washing one’s hands with a sponge and soap is sufficient if there is fear of contamination. It has been noticed that washing the anal area takes place in the same way but that no one every proposed excision of the anus. In addition, excision can close the vulva (by scarring or infibulation) and keep the urine and menstrual flow from running down the usual channels, This can provoke acute retention of urine and menstrual blood, and lead to a state known as haematocolpos which can seriously compromise the health of the girl or woman concerned and created much worse odors than those from normal hormonal secretions.

2 Aesthetic aspects

The configuration, structure and function of most of the organs of the human body are determined by genetic and hormonal influent. The body’s sexual hormones determine the distinctive characteristics of each sex. The male hormone stimulated grown and the function of all those organs that (like the penis) play a role in the male, just as it stop the growth of all those organs that the two sexes have in common (the breast, for example). In the same way, the female hormone stimulates development of the mammary glands (for the production of milk). A clitoris that grows abnormally in a female or breast that enlarge anomalously in a male are outward signs of an internal disorder that should be dealt with immediately. Just as no one would every dream of excising the breast of a young man (to avoid their developing later one), a girl’s clitoris should never be touched since it cannot grow beyond a certain size. In addition, it is surprising that reasons of aesthetics and hygiene are invoked to justify excision. The harden scar and the stump that normally replace the clitoris, or the skin pulled to cover a long scar in the case of an infibulated vulva does not look normal.

3 Safeguarding health

The belief that an excised woman has a better chance to stay in good health is clearly not valid. In traditional communities, women rarely complain. There are numerous

examples in literature of excised women suffering from a multiple of ills caused by their operation. Their societies have taught them that this suffering is part of their condition as women. Generally speaking, in communities that practice excision, certain organs and certain bodily function are never mentioned and women are therefore required to ignore and bear any of the harmful consequences of excision as well as possible. We should also point out that it is often difficult for excised women to see the connection between infirmities or illnesses that come on them as adults and the FGM/C to which they were subjected during childhood and considered an isolated, far off episode.

4 Protection of fertility

The reasoning by which excision reinforces fertility and fecundity is absolutely groundless. Actually, the opposite is true. Excision is one of the causes of sterility, particularly among girls who develop pelvic infections after excision. The secretions believed to have a toxic effect on sperm are actually innocuous and are a lubricating mucus, eliminating the friction between the extremely sensitive walls of genital organs.

5 Prevention of stillbirths

There is no scientific basis to the idea that contact of the infant's head with the clitoris during labor can cause death. Actually, the large number of normal healthy children born to non-excised women is proof that the argument is groundless. To the contrary, there is a much higher percentage of stillbirths due to prolonged labor in excised women.

6 Improvement of male sexual performance

The reasoning that excision increases male sexual performance is only valid where tradition induces men to believe that sexual pleasure and performance can be obtained in excised women who passively support the sexual act. The truth is that men only rarely claim that female passivity contributes to sexual pleasure. Men interviewed on a random basis in some African countries have admitted that sexual relations with non-excised women were much more satisfying than with excised women. Many women have equally stated to family planning agents working in urban areas their belief that their husbands prefer rivals who are not excised. This is due to the fact that penetration in a well lubricated vulva of an excited woman is even more gratifying for a man than a woman.

7 Preserving virginity

From a material point of view, the "virgo intacta" is a girl whose hymen is still intact. From a psychological point of view, a virgin is a young woman who has never had sexual relations, i.e. whose vagina has never been penetrated by a penis. Presumably, at the moment of excision, since the walls of the vagina are scraped, the hymen can be torn and the girl could lose her virginity. At the same time, a girl can be a virgin in the literal meaning of the word and find herself pregnant as a result of heavy petting (if the sperm is ejaculated near the vagina).

8 Prevention of promiscuity

Every community has the right to take steps to oppose behavior that risks breaking the daily balance of community life. However, promiscuity is a form of conduct that arises from a complex combination of social conditions on which maintaining or eliminat-

ing sensitive sexual organs have no direct influence.

A study conducted in Sudan has demonstrated that excision is not a way of stopping prostitution, here seen as a sign of promiscuity. Prostitution aside, some excised women believe that they are prevented from reaching certain levels of pleasure. After interviews with 50 urban women in Sierra Leone who had sexual experiences before excision, the researchers observed that none of these women ever reached the level of satisfaction they had before excision—and that before the interview, they had no idea that this lack was the result of excision. Some of the women interviewed admitted that their stubborn search for an ideal partner had cost them their husbands and their homes. Thus, an operation aimed at eliminating promiscuity risks achieving the opposite effect.

9 Promotion of social cohesion

The belief that excision assures social integration is a real problem, since the right of membership in a community and to be accepted as a full member should not be obtained at the price of human suffering and death. It should be possible to formulate other rules and conditions of acceptability that do not compromise the health of women and girls while preserving the social values and positive rules inherent in rites of passage. Practices that are dangerous to health (like excision) should be eliminated. Actually, the societies that are responsible for organizing rites of passage often pose laudable goals. In order to achieve these goals, initiation rites need to be altered and there must be teachings to prepare girls for their new status of womanhood (without excision). That kind of change does not necessarily mean, as is believed, dissolution of feminine society. It should be understood as a way of transformation or orientation towards a better life for everyone.

10 A religious practice

It is truly astonishing to see the extension of the practice of excision in the name of religion when neither the Qur'an nor the Bible mention it. Reviewing the writings of Moslem exegetes, no mention of excision is found in the Qur'an. According to the Qur'an, God created human beings in the best possible form, so why deform the work of God? Islam prohibits the practice of all that is harmful and, as a result, prohibits excision because it is physically and psychologically injurious. Islam respects women and guarantees them all rights to live a satisfying, normal life. Excision is not practiced in any of its various forms in Islamic states such as Saudi Arabia, Iraq, Iran, Jordan or Libya. Actually, some of the most prestigious religious leaders and theologians completely disapprove of the practice. It is sometimes sad to note that there is absolutely no consensus within Islam in favor of the elimination of excision. While most exegetes state that citations of the Habits have been changed, others have a different point of view on this subject.

Activity 2

IS FGM/C A WOMEN'S AFFAIR?

Time: 1 hour

Why do this activity?

Why African women, often also with high education, defend the practice?

In literature on FGM/C, both in the mainstream media as well as in specialised publications, it is often repeated that FGM/C is "a women's affair". Women are those subjected to the practice. Mothers, grandmothers, aunts are those requesting the practice to be performed on girls. Women are, in the majority, the traditional practitioners themselves. Mothers and other female relatives or neighbours are those who hold the girl down and still while the knife cuts.

So often the question is raised: why do women in Africa insist on circumcise their girls and why even the educated of them still defend the practice? This activity is meant to familiarize planners with the role women play in FGM/C and with its complex outcomes for women's lives and empowerment in rural as well as in urban settings, in more "traditional" as well as in more "modern" contexts.

As abandoning the practice implies a fundamental change in behaviour, also hidden meanings and dynamics of its performance need to be understood and considered by program officers before planning activities. This concerns both, the ritual itself, which is on its progressive and apparently irreversible disappearance in many settings/countries, with increasing FGM/C performed on very young girls (up to babies of a few months), and by non-traditional practitioners, leaving girls deprived of the emotional and cultural surroundings that helps taking care of the pain endured and transmuting it into pride, dignity and force; and the values attached to the practice, today condensed in a simple word justifying the continuity of the performance: it's "tradition".

The disappearance of traditional rituals opens an entry point to women's empowerment without cutting.

Objectives

- To understand the complexity of FGM/C and why women continue the practice, notwithstanding the harmful consequences.

3 How to do the activity

Step 1: 30 minutes

This is a small group activity. It is based on the analysis of anthropologists and experts with the aim of challenging the "women's affairs" stereotype and look deeper into it.

Each group is given one of the handouts with different case studies, as well as the handout with "Questions for guiding the discussion". Ask the group to read it carefully and then discuss it.

Participants should confront the content of the handout with the myths and realities already discussed in the first activity.

Ask each group to choose a rapporteur to present considerations of the group to the plenary. Walk around and listen to the groups. If they are battling, then help them along offering alternative perspectives to look at the issue. Always try to move the discussion between the "violation" vs. the "empowerment" approaches to FGM/C.

Step 2: 30 minutes

Bring the group together. Ask each rapporteur to present the result of the discussion in small group, including a synthetic presentation of the content of the handout. Ask participants' comments. Keep the set of questions that have guided the discussion in mind, and try to let the double side of the practice emerge:

- on one side FGM/C is a practice that oppresses women, violates their bodily integrity and human rights, reduces and subjects their natural sexuality;

- on the other side, it grants women freedom of movement, dignity, respect and social recognition, access to resources and decision making within community, adult female identity.

Guide the conclusion of the discussion towards the question:

Can FGM/C be abandoned / replaced without setting women's condition back?

For example, is there a connection between the transformation of the practice in Somalia, with number of families seeking less severe forms of FGM/C instead of infibulation, and increasing women's segregation, rigid dressing codes and imposition of the Islamic veil?

The question above does not need to find a definitive answer at the end of the discussion. It can be left to the group to think about it, as it will be raised again within the section dedicated to programming activities.

Small group discussion

Handouts

Plenary discussion

Note to facilitator

Materials

- Copies of handouts for each group.
- Flipchart paper
- Felt-tip pens.

Handouts

- Handout 1: Questions for guiding the discussion
- Handout 2: Not born as a woman, but created as a woman by culture
- Handout 3: Sierra Leone: women's secret societies and FGM/C
- Handout 4: Why is FGM/C such a strongly upheld 'traditional practice' and is it 'harmful' or useful to women?

Readings

QUESTIONS TO GUIDE THE CASE STUDY ANALYSIS AND PRESENTATION

1. Give a synthetic presentation of the case study
2. Which is the attitude of women in the case study towards the practice?
3. Does the practice contribute to women's empowerment?
4. If yes, how?
5. Are eventual negative consequences of the practice recognized?
6. Is there conflict between traditional and modern ways of socialization of women?
7. Which are the changes in the socialization of women already affecting the practice in your environment?

NOT BORN AS A WOMAN, BUT CREATED AS A WOMAN BY CULTURE*

Female genital mutilation is a fundamental component of the initiation rites performed in a traditional society to become a "woman". One is not born a woman, in the sense that the biological connotation is not in and of itself a sufficient factor of identification. For that, rites are needed to transform membership in an ascribed sex to an acquired status, freeing biological destiny of sex and allowing it to become a "social essence": a woman. It is the rites that decide a person's identity, starting with ascribed belongings such as sex and age. By separating it from biology, rites inform a person of his/her identity, indicating what s/he is and should be.

Of course, this does not happen only in Africa. With differing emphasis, every society transforms biological sexuality into a cultural construction, differentiating between male and female to decide gender membership. Gender is a process of the definition of self according to the connection to cultural models historically built on the difference between the sexes. For the most part, they are implicit models in their ways of acting, projecting the difference between the sexes on the cultural level, redeeming them from pure biological belonging. The state of gender in complex societies is subject to continuous negotiation, in the sense that none of the distinctions between men and women is destined to remain the same for long. As such, these distinctions cannot be taken for granted. In traditional societies, on the other hand, gender is better established and, at present, seems fairly unchangeable.

In African societies, the creation of gender identity is first of all physical manipulation of the body. With respect to the ceremonial aspects of the rites of initiation, which take care of the symbolic control of the passage of status, female genital mutilation does something more: it carves the woman's gender identity onto her body. And it does so in two ways, first, by changing the morphology of her body and then by shaping its expressiveness.

Along with manipulation of the woman's body, mutilation forms the physical appearance, proportion and harmony among the various parts, the exis (final outcome), posture and bearing, giving a woman's body what anthropologist Marcel Mauss calls "techniques", those automatic body gestures and movements that, in different ways, represent "femininity" in every culture. This is particularly visible in infibulated women whose lithe, slow gait is a result of the operation that makes a series of movements very difficult. The operation brings the legs closer together, restricting the intermediate space and keeping women from separating their tights too much. This forces the woman's body into a carriage and stride that we could define as centripetal. After they are infibulated, the girls are re-educated to use their bodies, choosing certain movements and postures that are compatible with the changes brought by the operation, abandoning others that might compromise its results and reopen the freshly sutured wound. "Careful, don't run, don't play ball, you'll tear," admonish their mothers. The latter take it on themselves to teach their daughters to discipline their bodies according to rules and models of behaviour inspired by the women's subordinate role in society and characterized by rigid differentiation and separation of male and female. The operation also ends any form

of promiscuity between boys and girls who stop playing with each other, not only because the operation makes any type of activity we associate with masculinity, like running, playing with balls, jumping, and so forth difficult, but also because the new status of woman forbids it.

The natural body is impure because it is open and violable, exposed to a promiscuity that can contaminate not only the individual woman but her entire family group which would be discredited and shamed. In this scenario, female genital mutilation is the only way of protecting women from the male desire that is always lurking and especially from herself. That helpless body is defended by a cultural construction of bodies that deprives them of all tumescence and excess, making them smooth and innocent after stealing their naturalness and pleasure.

But there are two important relationships at play here: between the sexes and between the generations, mother and daughter in particular, which initiation rites make extremely visible and dramatic. The mother-daughter relationship is much more ambiguous and controversial than that between the sexes, basically an asymmetrical relationship of domination, based on the marital strategy linked to the bride price.

In the mother-daughter relationship, we find psychological rivalries and destructive instincts that are condensed, expressed and neutralized in the period of time required for the ritual performance. This is true from the point of view of the daughters who see in the rite a legitimization of their own sense of guilt at taking over their mothers' position, and from the point of view of the mothers who "betray" their daughters' trust, becoming persecutors and thus expressing their envy for their reproductive capacity. Then, all is forgotten, including torture and suffering, once the "passage" has taken place.

At the rite's end, only the bodies preserve the memory in the form of a scar appointed to represent the sign of membership in one's ethnic group.

* Excerpts from: Carla Pasquinelli, *"Anthropology of Female Genital Mutilation"*, in *Stop FGM. Legal tools for the prevention of FGM, Proceeding from the Expert Consultation, Cairo 21-23 June 2003*, published by AIDOS and NPWJ, Rome, 2003.

SIERRA LEONE: WOMEN'S SECRET SOCIETIES AND FGM/C

The two [most salient social organizations, who care for initiation and circumcisions among the Kono, a Mande speaking group of Sierra Leone] are Bundu, female "secrete societies" and Poro, their male counterpart.

Most important, the soko [leader of the Bundu] has the socio-religious authority to create "woman" - that most productive and reproductive asset as far as patriarchy, that is, male-headed families, compounds, villages, and lineages, is concerned. She gives religious, social, and cultural sanction to women's reproductive and productive roles: an initiated or well "trained" woman will fulfill her social responsibilities as mother and as farm laborer. Given the traditional socioeconomic primacy of marriage and motherhood among the Kono, as in most African cultures, and Bundu's paramount historical function of producing marriageable women committed to accomplishing their productive and reproductive roles, the soko is charged with the most credited task in society.

However, the role of Bundu and its leaders in this regard has engendered some controversy among scholars [who] have criticized female ritual officials as colluding with patriarchy in order to maintain the subordination of women in society. This position, however, misses the point that female subordination is much more complex and situational than Western analysis permits.

What Bundu teaches first and foremost is the subordination of young girls and women to female elders: their mothers, future mothers-in-law, grandmothers, older women within the community, and, of course, female ritual leaders.

Secondly, novices are taught the art of subservience to some categories of men, that is, their future husbands and other male representatives of those lineages." In the first instance, vis-à-vis female elders - that is, within their own sex group - initiates and younger women are inferior. [...] But ritual leaders do not only teach subservience. They themselves are examples of ultimate female authority: wise, unyielding, and unsentimental. It is the soko's responsibility to see to it that novices are inculcated with the ideals of femininity as laid down by previous ancestresses: stoicism, which must be displayed during excision; tenacity and endurance, which are achieved through the many other ordeals a novice must undergo; and, most important, "dry-eye" that is, daring, bravery, fearlessness, and audacity, qualities that will enable young women to stand their ground as adults in their households and within the greater community. Thus, the soko has a paradoxical responsibility of "creating" dual-natured "woman": a community-oriented and subservient person to be exchanged in marriage, as well as a defiant individual who capitalizes on the bolder qualities ingrained in her feminine identity in defending her own goals, priorities, and stakes within society.

Female elders flank the upper echelons of Bundu. The next and most important category of women as far as the continuation of initiation and excision is concerned are the middle-aged grandmothers, whose critical job it is to put pressure on their daughters, who may be wary young mothers. These eminent elders have significant moral and emotional control over their married daughters. New mothers often spend a great deal of time in their natal villages under the supervision of their own mothers, particularly after the birth of and throughout the weaning period of their

children. This group of older women are well aware of their importance when it comes to initiation and are often the ones spearheading the organization and orchestration of their granddaughter's ceremonies. It is incumbent on mothers to initiate their daughters properly, according to ancestral customs, in order for the latter to become legally recognized as persons with rights and responsibilities in society. Thus, there is enormous cultural demand for mothers to conform to the tradition of initiation, no matter how far their travel, the length of their absence from their local communities, and for those who are abroad in Europe or the United States, the intensity of their "Westernization."

For Kono women living in the diaspora, there is not much difference because many remain very close to their mothers. Although older women and female ritual officials put tremendous social pressure on mothers to "circumcise" their daughters, this pressure does not sufficiently explain why most women adhere to the tradition. [...] The reluctance of women to disengage from female "circumcision" could well be a result of gauging what other women will do - that is, some women may not actually support the continuation of the practice, but they do not want their daughters to be the odd ones out.

Kono women living in the diaspora explain that they want their daughters to enjoy the same legal rights as other women, and even more, they want them to "fit" into Kono society and be respected among their peers and the entire community of women. My own personal experience, which is hardly unusual, is a case in point. I am often reminded by Kono relations that had I not undergone initiation, I would not be able to be involved in meetings concerning "women's business," that I would not be able even to speak as a "woman" or on behalf of any women. Moreover, no initiated Kono woman would dare to talk to me about Bundu. In short, I would be ridiculed and maligned as an arrogant puu moe [white person] or worse, an "uncircumcised woman", the ultimate insult against a woman. At the same time, these women do not necessarily believe that their Western-born or -bred daughters will care to be integrated in or accepted by Kono society. In fact, some admit that their daughters, if left to themselves, have no intention of visiting Kono or even Africa for that matter (given the negative image of war and poverty), let alone of marrying Kono men.

Societal coercion and pressure to conform, however, do not explain the eagerness and excitement felt by vast numbers of participants (residents in Kono as well as outside) in initiation ceremonies, including mothers of initiates, even if these same mothers also experience anxiety over the safety of their daughters. It is difficult for me - considering the number of these ceremonies I have observed, including my own - to accept that what appear to be expressions of joy and ecstatic celebrations of womanhood in actuality disguise hidden experiences of coercion and subjugation. Instead, I offer that most Kono women who uphold these rituals do so because they want to they relish the supernatural powers of their ritual leaders over against men in society, and they embrace the legitimacy of female authority and, particularly, the authority of their mothers and grandmothers. Also, they maintain their cultural superiority over uninitiated/uncircumcised women.

* Fuambai Ahmadu, *Rites and Wrongs: An Insider/Outsider Reflects on Power and Excision*, in Shell-Duncan, B. and Y. Hernlund, *Female "circumcision" in Africa. Culture, controversy and change*, Lynne Rienner Publisher, 2000.

WHY IS FGM/C SUCH A STRONGLY UPHELD “TRADITIONAL PRACTICE” AND IS IT “HARMFUL” OR USEFUL TO WOMEN?*

As an African feminist and physician I have, in the past, been plagued and irritated by the nagging question: why do women in Africa insist on circumcise their girls and why even the educated of them still defend the practice? Studies show that women medical doctors refuse to condemn the practice in a society where infibulation is the norm. It may be easy to lay the burden of the demand for FC/FGM on the shoulders of men or, more accurately, on patriarchal society including the women within it. While such analysis still holds, there is still the unresolved issue of why women defend the practice even when men in their family or their community want to abandon it.

The answer to this question revealed itself while we were conducting an analytical reviewing of major approaches taken against FGM in the past twenty years, which we undertook between 2001-2002. In extracting the elements of what worked and what didn't in persuading people to abandon the practice, we found that projects which focused on changing women's consciousness and, in some cases, their material conditions had a significant effect on accelerating the rate of abandonment. We also found that for the change in women's attitude and behaviour towards FC/FGM to take root and be sustained it must gather sufficient supported from power holders in the community such as husbands, health professionals, religious leaders and policy makers.

This finding made us look more carefully at our perceived notion that FC/FGM is harmful to women. On the basis of objective logic and scientific criteria FC/FGM is undoubtedly harmful to girls as it deprives them of vital sexual organs necessary for their health and holistic development.

The fact that the cutting happens to minors who have no true powers of consent is a violation of their human rights under the Convention of the Rights of the Child. But these are 'our' logical and rational reasons for condemning the practice which attempt to transplant onto the women who want to preserve the practice. Women living in circumcising communities have 'their' own logic and rational reasons for not readily adopting our logic.

For them living under a strong patriarchal social and economic regime with very few option for choices in livelihood the room for negotiating a limited amount of power is extremely small. Circumcising your daughter and complying with other certain social norms, particularly around sexuality and its link to the economics of reproduction, is an essential requirement to these silent power negotiations. Women instinctively know this. We may scare them with all the possible risks of FC/FGM to health. We may bring religious leaders to persuade them that the practice is not a requirement. We can try to bring the wrath of the law to bear upon them. But in their desperate hold on the little negotiated power they have known for centuries, they are

not willing to let go unless they see a benefit that is equal to or more than what they already have.

* Excerpts from: Nahid Toubia, *"Legislation as a tool for Behavioural and Social Change"*, in *Stop FGM. Legal tools for the prevention of FGM, Proceeding from the Expert Consultation, Cairo 21-23 June 2003*, published by AIDOS and NPWJ, Rome, 2003.

Activity 3

3

IS FGM/C A RELIGIOUS PRACTICE?

Time: 1 hour

Why do this activity?

FGM/C is a native practice, deeply rooted in the local society. It existed in sub-Saharan and Central-Eastern Africa before the introduction of Islam in 1050, after the religion had established itself in Mediterranean Africa over earlier centuries, eliminating the ancient Christian Churches.

The fact that the origin of FGM/C in Africa is frequently attributed to Islam is probably due to the ease with which it adapted to indigenous traditions and conformed to local life. The penetration of Islam was possible due to the presence of certain elements in African culture, such as the patrilineal social structure and the concept of a strong sense of dependency on God. These elements fostered its acceptance, allowing Islam to take root in the traditional fabric of society much more deeply than the various Christian churches that started evangelizing the African continent several centuries later. This “Africanization of Islam”, also expressed in the adoption of the local name for God as translation of the name Allah, made it much more tolerant of female genital mutilation/cutting.

With time, identification of Islam with the native tradition became so complete that it subsequently became the main agent for the diffusion of FGM/C outside of Africa, exporting it to Indonesia and Malaysia, among others.

Addressing the issue of Islam and its connection to FGM/C, in light also of the conversion to Islam by increasing populations in Africa, is of particular importance for designing campaigns that do not clash with recognized religious authorities/values and might therefore be rejected by the target population itself as disrespectful of spirituality.

Objectives

- To confront different positions and arguments concerning religion, in particular Islam and FGM/C.
- To become aware of the significance attributed to FGM/C by African women of Islamic faith.
- To understand its role in propagating the practice, as well as its potential in contributing to its abandonment.

3 How to do the activity

Step 1: 10 minutes

Introduce the topic underlining that no revealed monotheistic religion in Africa is exempt of connections with FGM/C:

it can take the shape of early open opposition as with Christian missionaries spreading of the region in past centuries, and ending up with a sort of silent, not expressed tolerance of the practice, in order to facilitate evangelisation;

the same kind of tolerance can be found among Coptic religious authorities, as well as Jewish ones (as in Ethiopia);

in recent times leaders of all religions started to speak out against the practice, sometimes within their communities, sometimes in public gatherings (such as the Banjul Symposium for Medical Personnel and Religious Leaders organised by IAC, the Inter African Committee, in 1998).

Put on the Overhead 1 "FGM/C prevalence rates according to Demographic and Health Surveys (DHS)" with prevalence data from the DHS Surveys. Write the prevalence rate next to each country: it will be evident, as DHS Surveys have shown, that FGM/C prevalence is higher in countries where Islam is the prevailing religion, although it is very diffused also in countries with other religious compositions, such as Ethiopia (mainly Coptic Orthodox).

Step 2: 50 minutes

Divide participants in 3 small groups. Each one will work with the text presented in one of the Handouts. Distribute also the Handout with the Outline for analysing the text. Ask the group to choose one person to read the text out loudly, and then invite each group to analyse with particular attention to:

Elements that may come up during discussion

where the action takes place (urban/rural setting);
the role played by different stakeholders (highlighting protagonists);
direct and indirect development issues that interfere (such as education of women, direct access to sacred scriptures, migration);
role eventually played by foreign actors;
presentation of religious teachings;
strong or weak messages;
eventual reactions: positive? negative?

Ask each group to evaluate, according to selected point of analysis, if the facts presented in the Handout contribute to

the continuation of the practice
the abandonment of the practice

and how.

Step 3: 50 minutes

Ask each reporter to summarize the content of the handout the small group has been working on, then to present their list of considerations and their evaluation about possible contribution to continuation or to abandonment of the practice. Invite other participants to comment on the cases presented. Try to understand the role religious leaders can play and possible ways of involving them.

Plenary

Small group activity

Note to facilitator

Plenary discussion

Note to facilitator

Main points to bring out:

Across nations and cultures practicing some form of female genital mutilation/cutting, the perception that it is a religious obligation, or at least a religious virtue, is ubiquitous.

The belief that FGM/C is required by religion is “common.” Although it is not a practice of the majority of Muslims in the world, among those who do practice it, “female circumcision” is nonetheless often considered to be legitimated by religion.

A disingenuous refusal to see the connection between FGM/C and Islamic religion can serve the interests of Muslims who want to defend their religion and culture from Western criticism.

While it was not at the origin of the practice on the African continent, interpretation of Islamic scriptures has been done in order to suit the practicing community. Today, this close identification with traditional cultures is becoming a problem. Part of Islam, including the fundamentalist clergy trained in Saudi Arabia, is trying to distance itself from the most destructive forms such as excision and infibulation, sometimes only to propose the practice of *sunna* instead. However, in practice under the name of *sunna* different types of FGM/C are meant, some of them only little less intrusive and damaging than infibulation itself.

Arguments from within religious texts can be useful for advocacy purposes, as well living examples of those religious leaders who have decided to spare their daughters from the knife, but it has to be remembered that the large majority of the population does not have direct access to religious texts.

Activists, including Western NGOs and International organizations should be careful in affirming adamantly that “no religion does support FGM/C” and need to look closely into real community life to understand the role religion plays, including Christian, Catholic, Coptic and Islamic religion, in perpetuating the practice.

Materials

- Flipchart paper
- Felt-tip pens
- Paper and pens for participants to write notes
- Copies of handouts for each small group

QUESTIONS TO GUIDE CASE STUDY ANALYSIS AND PRESENTATION

1. How religion, particularly Islam, is used to justify the practice of FGM/C?
2. How does religion and cultural identity, including traditions, customs etc., intersect and overlap?
3. How do **religious institutions** perpetuate the status quo and/or control changes in the area of FGM/C?
4. Can you think of other development areas where religion/religious institutions play a role?

ISLAM AND FEMALE CIRCUMCISION

Even if female circumcision is practiced by people with a variety of religious orientations, there is a general tendency to associate female circumcision with Islam.⁶ Here I shall briefly discuss some of the possible positions from a Muslim perspective. As my Somali informants refer to the Qur'an and the hadith when they explain their dissociation of any harsher forms of female circumcision, the discussion here will focus on these sources. This is interesting, considering that the Somalis belong to the Shafi'i school of fiqh, which is one of the two Islamic law schools that interpret female circumcision as required. The form recommended is a mild type. It is a paradox, however, that in many parts of the Muslim world where the Shafi'i school dominates, the practice is nonexistent.

Muslim researchers and activists have engaged in the debate over whether female circumcision is an Islamic practice or not. There is no way to state a "true" Islamic position, as all of those involved argue from their own interpretations of the written sources. This section will work as a background to the statements made by many of the Somalis in this study, who claim that further reflection upon Islamic teachings made them reassess the practice of female circumcision.

Female circumcision is not practised in an overwhelming majority of Muslim societies in the world. Indeed in 80% of the Islamic world, the practice is unknown. The practice was firmly rooted in parts of Arabia and Africa thousands of years before these areas were Christianized or Islamized. After the coming of Christianity and Islam, the customs were integrated into the religious belief systems. Female circumcision is not mentioned in the Qur'an. The religious sources at hand, then, are the hadith. The most frequently quoted hadith, both in the literature and among Somalis I talk to, is the one about how Prophet Muhammad talks to a circumciser on her way to perform the procedure. Prophet Muhammad then says, in one of many possible translations into English: 'Do not overdo it, because it [the clitoris] is a good fortune for the spouse and a delight to her'. There is a weakness in the chain of transmission of this hadith, which cause some scholars to claim that there is no sunnah to comply with in the matter of female circumcision.

Strong or weak, it is still not clear how to interpret it. Some Muslims claim that Prophet Muhammad advocates a mild type of female circumcision, a symbolic operation where nothing at all or only a tiny part of the clitoris is removed. Most Muslim scholars believe that Prophet Muhammad would have condemned what is today known as infibulation. "Circumcision not carried out according to the sunnah [of Prophet Muhammad] is forbidden by all religious circles", says Sami Abu-Sahlieh. Yet other scholars understand the hadith as a way for Prophet Muhammad to condemn the tradition of female circumcision altogether, and claim that his utterances show that he, in time, had the purpose of being more outspoken about his opposition. In the same way as Prophet Muhammad step by step dissociated himself from the use of alcohol, Muslim intellectuals in Sophie Roald's study argue that it is possible to believe that he had the intention to counteract the harmful practice of female circumcision. There is no evidence that Prophet Muhammad had his own daughters circumcised; a fact that has been used as an argument against female circumcision by those opposing the practice. Another hadith, among the few mentioning female circumcision, includes this instruction: 'If the two circumcised parts have been in touch with each other, ritual

purification [ghusl] is necessary'. Ritual purification of the whole body, ghusl, should be undertaken when a man and a woman have had sexual intercourse. Are these words to be understood as if Prophet Muhammad supported circumcision of women? [...] The statement may be seen as a comment upon the fact that there were circumcised women in the area where Prophet Muhammad lived at this point in history, and does not have to be interpreted as an approval of the tradition per se.

Finally, another weak hadith, awakening controversy among scholars: "Circumcision is a way for men, but is merely ennobling for women". The most frequent interpretation of this hadith seems to be that circumcision is a religious duty for men, while it is an honourable act for a woman - "there is no harm if a woman is circumcised whereas for a man circumcision is unavoidable", as a scholar from the tenth century put it.¹⁹ Many scholars, though, seem to ignore this hadith, as it is considered weak. Some scholars are of the opinion that if female circumcision is to be performed - "there is no harm in not doing it, and there is some reward in doing it" - then only a mild operation, either a pricking or a removal of prepuce, is to take place. Removal of the whole clitoris in a woman can be compared to removing the penis of a man.

Muslim scholars propagating for the abandonment of female circumcision find some support in the Qur'an. The passages "Verily, we create man in the best conformation" (95:4), "Let there be no alteration in Allah's creation" (30:30) and "He perfected everything he created" (32:7) are often adduced to lay down the fact that genital operations in women strongly conflict with fundamental values in Islam. These Muslims scholars' attitude is paradoxical, as they at the same time accept male circumcision-such a procedure also changes God's creation. But none of my informants, who claim that they are opposed to (harsher forms of) female circumcision with the argument that Islam forbids any harm to God's creation, have mentioned that they have a problem accepting male circumcision. The tradition of female circumcision has met with opposition among Muslim scholars also in historical times, e.g. in Imam Abu Hanifah in the eighth century, according to Anees. Abusharaf reports a later example: noted Muslim leaders in Sudan launched successful anti-circumcision efforts as early as in the middle of the nineteenth century. The stand taken by most Muslim scholars on the tradition of female circumcision seems to support mild or symbolic sunnah circumcision or no circumcision of girls. Claims that Egyptian Islamists have an indifferent attitude to the practice or favour it, living in a society where it is widely practised, whereas "Islamists from other Arabic-speaking countries tend to have a strong emotional reaction against it" (Roald), the strongest being an opposition to female circumcision. According to Giladi and Abu-Sahlieh, the position of the ulama today urges the faithful practising female circumcision to adopt the most moderate form of circumcision.

Despite this fact, many lay Muslims understand clitoridectomy and infibulation to be religious duties. This makes sense, if one considers the fact that to the great majority of people who practice female circumcision, the religious texts are out of reach. Reflection upon Islamic sources is an activity restricted to the educated and the religious elite, and the discussion does not reach ordinary people. Religious texts do not necessarily guide people's practices in everyday life. Indeed there is reason to believe that legitimating infibulation by means of religious arguments would be trickier if people had access to the religious sources.

* Excerpts from: Johnsdotter, S., "Somali Women in Western Exile: Reassessing Female Circumcision in the Light of Islamic Teachings", in *Journal of Muslim Minority Affairs*, vol. 23, n. 2, October 2003

BECOMING A MUSLIM: FEMALE “CIRCUMCISION” AND RELIGIOUS IDENTITY AMONG THE MANDINGA*

When asked to explain the reasons behind clitoridectomy, Mandinga informants assert that it is a cleansing rite that defines a woman as a Muslim and enables her to pray in the proper fashion, both of which are defining features of Mandinga identity. As one elder woman from Bissau explained:

"The Pepel, the Mankanya, the Bijugus, many groups do not go to fanadu; just the Muslim groups, the Mandinga, the Biafada, and the Fula, because we have to pray. If you don't go to fanadu, you will have an odor there [in the genital region] and you will not be clean. If you cannot pray, then you are not a Muslim, and Mandingas are Muslims".

This need for cleansing or purification fits with Muslim ideas concerning gender and the life cycle. As women progress through the life cycle, changes in the body affect changes in purity and hence in religious participation. Often, changing bodily states have contradictory effects on women's public and private religious lives. Physical maturation can have a positive effect on religious practice and identity. As Susan Rasmussen notes for the Tuareg of Niger (1997), women begin to take part in religious observances such as obligatory prayer and fasting upon their first menstruation. At the same time, however, as women mature physically they come into contact with polluting substances such as menstrual blood, the blood of childbirth, and bodily emissions of young children, all of which limit women's involvement in religious activities such as prayer and going to the mosque. Among the Mandinga, clitoridectomy is considered to be at least a partial solution to the problem of compromised purity associated with physical maturation.

Recent campaigns to alter or eradicate excision practices in Guinea Bissau that have been led by foreign aid organizations, local and foreign healthcare workers, and government agencies have responded to this explicit link between female "circumcision" and religious identity as perceived by many in Guinea Bissau.

Focusing on educating women about the negative health consequences associated with the practice, these activists started by trying to convince women that Islam does not advocate female "circumcision," nor does the Qu'ran prescribe it. In my research with Mandinga men and women, however, I discovered that the relationship between female "circumcision" and Islam extends beyond what is explicitly stated (or not stated) in Islamic texts. Whether others claim that Islam does not advocate the practice for women is not the issue, since many Mandinga with whom I spoke are fully convinced that it does. After discussing this issue with a medical doctor in Bissau leading the campaign against "excision" in Guinea Bissau, I decided to engage Mandinga men and women more actively on the connection between female "circumcision" and Islam.

When I asked how female "circumcision" began and why the Mandinga first started practicing it, several women (and some men as well) told me the following story, which they claimed comes from the Quran. The version that I cite here was taken

from a recorded interview I conducted with an elder Mandinga woman who lives in Bissau and whose grandmother was a ngamano (traditional circumciser). She explained:

"It was from the side of Mohammed that we took this thing [female "circumcision"]. Mohammed took a wife who was very old - so old that she couldn't have a child. They wanted to have children so they looked for a way around this problem. Mohammed adopted a young girl who would become his second wife and who would give them a child. Now, as time went on, his first wife began to realize that Mohammed was growing to like the young girl more than his first wife. She quickly became jealous of the young girl, who soon became pregnant. When Mohammed went on a trip - and he travelled a lot in those days - the old woman took the young girl into the courtyard and slit [pierced] her earlobes. Because in those days only slaves [war captives] had their earlobes pierced, the old woman hoped that Mohammed, upon his return, would reject the young girl. When he arrived and saw what had happened, he said nothing. Mohammed was a powerful man and had many intermediaries who helped and advised him. Many of these men received direct messages from God. One of them heard about the incident and came to Mohammed. He said that God had spoken to him, telling him that Mohammed should not be angry, that soon all women would begin to slit [pierce] their earlobes just like his young wife. Mohammed bought some gold pieces and put them in his young wife's earlobes. She looked more beautiful than ever. All of the women in the village came to see just how beautiful she was. They all went home to slit [pierce] their own ears and collect gold pieces to put in them. Mohammed's first wife did the same. Mohammed left for another trip, and this time he was away for three months. Again, he left his first wife in charge of the house. Since the old wife was still full of jealousy and spite for the young girl, one day in the early morning she took her into the courtyard and cut her little thing [clitoris]. When Mohammed returned from his trip and wanted to sleep with her, the young girl was afraid and refused him. Mohammed asked her: "What is it?" The young girl explained that she hurt down there. The old woman was content. since she knew that the young girl would not sleep with her husband because of the pain she was feeling. Mohammed prayed to God. A friend came to him and told him that he had received a message from God that Mohammed should not be angry. He said: "That little thing - now removed - will make your young wife even more beautiful and pure". Since the young girl was circumcised and God was content, the Mandinga put the idea of female circumcision into their heads, and that is how it all began".

Excerpts from: Michelle C. Johnson, *Becoming a Muslim, Becoming a Person: Female "Circumcision", Religious Identity, and Person hood in Guinea Bissau*, in Shell-Duncan, B. and Y. Hernlund, *Female "circumcision" in Africa. Culture, controversy and change*, Lynne Rienner Publisher, 2000.

SUNNAH: WHAT FORM OF FGM/C LIES BEHIND THIS NAME?

In Islam as practiced in everyday life, the association of religious ideas with female circumcision is evident in the colloquial terms used to describe the custom. The use of the term sunna (meaning to follow the tradition of the Prophet), implies that the custom is prescribed by religion. Similarly, although the classical Arabic term for female circumcision is khifad (literally "reduction"), in colloquial Arabic it is popularly called tahara, referring to a ritual state of purity that is required for Islamic prayer. In the bipolar opposition implied by the term tahara, genitals in their natural state...are ritually impure. In fact, in Egypt to ask if a woman is circumcised one asks "Intii mutahara?" "Are you purified?"

Among Somali women, Sunnah has been found to have at least four different meanings:

1. Sunnah, as a descriptive term for different types of circumcision; practically all forms of female circumcision except what is labelled pharaonic.
2. Sunnah, as a normative term for the only form of female circumcision said to be accepted by Islam: a ritual and symbolic operation where no genital parts are removed.
3. Sunnah, as a descriptive religious term (noun) denoting Prophet Muhammad's sayings and doings, the tradition as it is described in the hadith.
4. Sunnah, as a normative religious term (adjective) when classifying some actions to be recommended, within the framework of the Islamic normative system where actions are divided into categories depending on how desirable they are in a religious perspective.

Hello,

I found your e-mail address through a conversation in the Foko network of Scandinavian countries on the proposal by a Somali doctor on performing "Sunna" as a symbolic cut in hospitals in Italy. I just felt it timely to inform you about my experience from a three weeks study tour together with a Somali colleague in Somali areas in Kenya, Somalia and Somaliland, and the conversations we had with many persons who work in the field. What we saw in all organisations at grass-root level was a resistance to infibulation and support to the "Sunna" in all posters and information materials.

"Sunna" was promoted in at least three types:

- 1) Infibulation was called "Sunna" when the technique of fixing the labia majora was changed from sewing with thread and thorns to the use of herbs (mal mal) and tying the legs together. Thus FGM was infibulation, but renamed "Sunna" and as such supported by religious leaders and even posters and information materials of international NGOs.
- 2) "Sunna" in the form of excision with sewing or sticking of labia minora, thus

closing the vulva.

3) “Sunna” in the sense of removing part of the clitoris, that we never saw or heard of in practice, just in theory.

We also saw an increasing tendency of medicalisation and new groups, such as trained TBAs and paramedical staff, take up the practice.

Thus I am very sceptical that any medicalisation of a “minor” cut would actually be a minor cut, in addition to the other problems already mentioned. I have also heard that a project called “Water for life” supported “symbolic circumcision” in Somalia. In reality it also performed full-fledged infibulation:

Having also talked to Somali doctors and gynaecologists working with international NGOs against FGM and feeling even doubtful to what extent they are really against all types of FGM, makes me additionally worried. Many still expressed fear that uncircumcised girls would “run after boys” and could be rejected on the wedding day if she was still “open”.

Thus I believe that it is very dangerous to support “Sunna” that in reality is much more invasive than a “symbolic cut”. It must be stopped!

EGYPT. THE MINISTER FOR HEALTH, ISLAM AND CNN*

In Egypt, where the proportion of genitally altered women is among the highest in the world, there was a growing sentiment against the practice beginning in the 1930s and peaking in the late 1950s with a 1959 decree by the Ministry of Health prohibiting female alteration in public hospitals. (From the fact that Egypt has a prevalence rate of around 97%, one can infer that this prohibition merely insured that girls were subjected to this practice outside public hospitals.) During that period, female genital alterations (FGA) rose and fell on the agendas of various health and women's organizations, and was "initially of little importance to the Islamist movement."

This decree remained in place until 1994. That was the year when, at the International Conference on Population and Development in Cairo, women from all over the world took activist positions on the connections between women's health, family planning, and human rights. During the Conference, a CNN film was shown that depicted the circumcision of a little girl, in its most horrific form. The film galvanized international opposition to the practice, often in terms that even Muslim opponents of FGA found insulting and racist. "In the few-minutes-long segment a small part of Egyptian culture was displayed that seriously angered and 'shamed' Egypt before the international community."

Immediately after the film was aired, Egypt's Population Minister and members of parliament spoke publicly about the need to pass legislation criminalizing FGA. However, this was met with swift opposition from the Grand Shaikh of Al Azhar, one of the country's prominent Islamic leaders, who issued a fatwa (religious opinion) that "female circumcision is 'an Islamic duty to which all Muslim women should adhere.'" "[C]ivic, religious, and state entities and groups began to use the issue as a way to define their position on the Egyptian political and ideological map." The Minister of Health and the Minister of Population each made a promise to the international community to strengthen the 1959 decree and to work harder to eradicate the practice.

On its side, Al Azhar and traditionalist organizations launched a public campaign claiming that circumcision kept women free and independent and promoted female equality by preserving their virtue. Further, the campaign depicted female circumcision as an integral component of Egyptian national identity. Faced with growing political/religious furor, the Health Minister announced that he would defer any action until after the upcoming parliamentary elections. He then formed an advisory committee, whose advice he proceeded to reject. The committee had advised against legalizing FGA, and the Grand Mufti (the official government interpreter of Islamic law) had declared that the practice is not strongly endorsed by Islam and that its legality should be decided by physicians; nonetheless the Minister issued a directive making FGA "a legitimate medical treatment."

In 1996, a new Health Minister again banned the practice, this time both in and out of hospitals. He was supported by a new head of Al Azhar, Sheik Mohammed Tantawi, who found the hadith concerning FGA "too vague to constitute a ruling." The efficacy of the ban remains to be seen. In rural areas, where the prevalence of FGA is virtually total, it is unthinkable to most villagers that the practice not

continue. Doctors themselves, typically extremely conservative, inattentive to women's concerns, and with economic incentives to continue the practice, have challenged the ban, citing reasons of religion, health, and law. "Dr. Gamal Gaith, who works at the Minya el Qamh Public Hospital, said the decree finally prompted him to turn families away. 'I used to do it,' he said, 'even though I knew it was harmful for the women, because of the money.'"

Activity 4

FGM/C, POWER AND EMPOWERMENT

Time: 2 hours

Why do this activity?

The term *empowerment* has been widely used within development literature. It has been mostly used to refer to the end impact of developmental projects. Increasingly empowerment is recognized as an approach to development practice.

Perceiving empowerment as a process that denotes a change in the abilities and capacities of individuals and groups from one stage to another is a useful definition. This is especially true when discussing 'women's empowerment'. On the one hand, 'women' are not a homogenous undifferentiated category that are necessarily 'disempowered' and 'disadvantaged' merely by the fact that they are women. Moreover, women do not experience or negotiate situations of oppression or disadvantage in the same way. This is because they do not lead their everyday lives only as gendered subjects but also as individuals located in and belonging to different socio-economic and political hierarchies and power dynamics. The realization that women's identities are differentially and contextually structured and situated at the intersection of different (and sometimes conflicting) systems of stratification is particularly important in choosing the empowerment inputs in any projects as well as in analyzing and measuring its impact.

Organisations of women, or other popular organisations as well as local/national institutions which recognise the need to empower women, have to develop strategies to enable women to make decisions for themselves, and to take action for themselves. While NGOs, as intermediary organisations, can sometimes facilitate this role, it usually requires the existence of community based organisations - that is organisations at the grassroots- in order to achieve anything beyond some strengthened capacity at the individual level. Since women's empowerment requires changes in social values, it usually requires collective action. Empowerment is a process rather than only an end-point. Thus, well before changes in policy or programming have been achieved, women may have built their confidence in their right to demand change and to participate in processes of shaping the policy agenda.

During this session, we shall go through the different meanings of empowerment as used in development projects. We shall also discuss how FGM/C is used by women as well as other stakeholders as a power gaining tool.

Objectives

- To describe and assess different approaches to empowerment.
- To describe why empowerment is central to ending FGM/C

How to do the activity

Step 1: 20 minutes

Ask each participant the following question:

Why you personally oppose FGM/C / why are you involved in the struggle for the abandonment of FGM/C?

Participants might have a variety of reasons, but quite certainly some of them will come out with personal motivations that include

because the practice is undermining women's rights
 because I'm committed to human rights for all the people, and FGM/C is a violation of women's human rights
 because it is putting women's health in danger
 because I believe in freedom of choice, and FGM/C is something where women do not have a choice about
 because it is based on wrong ideas, on myths that are contradicted by reality
 because it is done on girls who do not have the power to oppose it

In other words, many of the reasons given for the personal commitment of participants towards the abandonment of FGM/C have to do with the issue of power: the power to defend themselves from the practice, the power to decide upon one's own life, the power to protect their own daughters from the practices, a.s.o.

Moreover, it will become evident that many of the reason given imply women's empowerment, that is often also the objective of other development programs and projects, such as income generating activities, family planning and safe motherhood healthcare services, education for girls etc.

Step 2: 10 minutes

Brain storm around meanings and definitions of **empowerment**. Ask participants to define empowerment. Use flipchart and ask one of the participants to note down participants' contributions.

Definitions might include:

- autonomy of women
- the improvement of their political, social, economic and health status
- equality with men in decision making process

Plenary

Note to facilitator

Plenary

- full participation and partnership with men in development activities, including productive and reproductive life
- sharing responsibilities for the care and nurturing of children and maintenance of the household
- policy and program actions that seek to overcome gender inequality
- improving women's access to secure livelihoods and resources
- full expression of women's capacities and potential
- elimination of inequality through laws enacted by the government
-

Step 3: 30 minutes

Handout 1

Distribute Handout 1 "Definitions of power" and ask participants to read it first individually. Allow sufficient time to complete the reading.

Small group activity

This exercise is meant to understand how is FGM/C used to 'negotiate power', in particular how is it used by women as well as other stakeholders to achieve

Definitions of power	What it implies
Power over ...	Conflict and direct confrontation between powerful and powerless groups
Power to...	Capacity building, supporting leadership skills and decision making abilities.
Power with...	Social mobilisation, building alliances and coalitions
Power within...	Consciousness raising, enhanced decision making abilities, increased self esteem and awareness

Divide participants into 3 groups. Assign a specific stakeholder to each small group,

- women
- grandmothers/elders
- fathers/husbands

and ask each group to outline how a specific stakeholder uses FGM/C to achieve all these perceptions of power. Each group should answer the following questions:

- Who has the most to gain from FGM/C?
- Who is more likely to resist ending FGM/C in the absence of other 'social negotiating mechanisms'?

Discuss implications in practice collectively.

Step 4: 20 minutes

Plenary

Reconvene the plenary.

On the flipchart draw the table below:

Question	Power over	Power to	Power with	Power within
How women use FGM/C to get...				
How grandmothers/elders use FGM/C to get...				
How fathers/husbands use FGM/C to get...				

and ask each group to present the conclusions of their brainstorming in 5 minutes.

Write the appropriate outcomes in the concerned cells so to fill the scheme together with participants.

Invite participants to consider the following:

Power is not unidirectional, nor is it quantitative. It is multi directional, complex and qualitative. This is to say that people (including women) attain different 'kinds' of power, using different negotiating mechanisms. FGM/C is a powerful power gaining tool as well as a 'negotiating tool' for women. Women are the main sufferers from FGM/C. They are also its main beneficiaries. This is why in so many contexts women are its main perpetrators. It is only through the understanding of this contradictory and sometimes conflicting role of women in sustaining the practice that we can begin to address appropriate interventions to end it. Thus, they stand to gain the most by perpetuating it and lose the most by abandoning it. Until, women can achieve the same gains that are traditionally acquired through FGM/C through other channels; they will be resistant to abandoning FGM/C. In order to design appropriate and effective women's empowerment inputs that would lead to the abandonment of FGM/C, we need to know what are the perceived 'gains' of FGM/C to the women in **the specific context** where the project/program will be implemented, looking at the broader development agenda.

Note to facilitator

To conclude distribute Handout 2 "Empowerment and the status of women", which presents definitions of empowerment and actions needed to reach it from the International Conference on Population and Development Program of Action (1994), the Millennium Development Goals (2000) and the Additional Protocol on Women's Rights to the African Charter of Human and Peoples' Rights (2003).

Handout

Materials

- Flipchart
- Copies of handouts for participants

Handouts

- Handout 1: Definitions of power
- Handout 2: Empowerment and the status of women

DEFINITIONS OF POWER

In order to fully understand the issue of “empowerment” within the context of FGM/C and its relation to designing effective programming frameworks, we need to look at its root concept: that of “power”.

Power over:

It concerns the decisions/decision making process over which there is observable conflict. It describes the ability to take the decisions that one wishes. It understands power as the capacity to make decisions, acquire new skills and solve problems. It underpins the most “women in development” projects and policies and is built on the assumption that women will have a higher decision making power / will be empowered where/when they have greater access to/control over resources, in particular economic resources, hence the focus on income generating activities and the like.

Power to:

A broad view of power that captures not only the enactment of decisions, but moves to include areas that are not customarily thought of as “decisionable”: i.e. what lies outside the area of direct observable decision making process. Thus it focuses on the less visible institutionalised forms of advantage and disadvantage that actually empower particular individuals/groups and impose their views of reality on others. Gender roles can be consider one of these forms of power to... do / be.

Both these understanding of power involve a dichotomy of domination/subordination where one side holds absolute power over a completely disadvantaged partner. These understanding of power have informed many theories in the social sciences and in development practice as well.

Power with:

This refers to the collective efforts of communities to achieve common goals. In particular if concerns the ability to negotiate with wider social actors as well as the ability and capacity to mobilize and seek support from wider social, political and economic actors.

Power within:

This is perhaps a more holistic understanding of power. It involves increasing self awareness, confidence and consciousness. It refers to the ability to understand the complex operations of power in the everyday life on the individual as well as the institutional level, and to the ability to effect change. It questions the assumption that power and conflict are necessarily linked: i.e. where there is no direct, observable conflict, consensus prevails. In fact, interests might be unarticulated or unobservable and, above all, people might be mistaken about or unaware of their own interests.

EMPOWERMENT AND THE STATUS OF WOMEN

“The empowerment and autonomy of women and the improvement of their political, social, economic and health status is a highly important end in itself. In addition, it is essential for the achievement of sustainable development. The full participation and partnership of both women and men is required in productive and reproductive life, including shared responsibilities for the care and nurturing of children and maintenance of the household.

In all parts of the world, women are facing threats to their lives, health and well-being as a result of being overburdened with work and of their lack of power and influence. ..The power relations that impede women’s attainment of healthy and fulfilling lives operate at many levels of society, from the most personal to the highly public political. Achieving change requires policy and programme actions that will improve women’s access to secure livelihoods and economic resources, alleviate the extreme responsibilities with regard to household, remove legal impediments to their participation in public life, and raise society’s awareness through effective programmes of education and mass communication. In addition, improving the status of women also enhances their decision-making capacity at all levels, in all spheres of life, especially in the area of sexuality and reproduction” (ICPD PoA 4.1)

All countries should make greater efforts to promulgate, implement and enforce national laws and international conventions to which they are party, such as the Convention on the Elimination of All Forms of Discrimination against Women – and to implement fully the Declaration on the Elimination of Violence Against Women – Countries are urged to sign, ratify and implement all existing agreements that promote women’s rights. (ICPD PoA 4.5)

“Countries should act to empower women and should take steps to eliminate inequalities between men and women as soon as possible by:

a) Establishing mechanisms for women’s equal participation and equitable representation at all levels of the political process and public life in each community and society and enabling women to articulate their concerns and needs; b) Promoting the fulfilment of women’s potential through education, skills development and employment, giving paramount importance to the elimination of poverty, illiteracy and ill health among women; c) Eliminating all practices that discriminate against women; assisting women to establish and realize their rights, including those that relate to reproductive and sexual health; d) Adopting appropriate measures to improve women’s ability to earn income beyond traditional occupations, achieve economic self-reliance, and ensure women’s equal access to the labour market and social security systems; e) Eliminating violence against women; f) Eliminating discriminatory practices by employers against women, such as those based on proof of contraceptive use or pregnancy status; g) Making it possible, through laws, regulations and other appropriate measures, for women to combine the roles of child-bearing, breast-feeding and child rearing with participation in the work-force”. (ICPD PoA 4.4)

1. States Parties shall combat all forms of discrimination against women through appropriate legislative, institutional and other measures. In this regard they shall:

- a) include in their national constitutions and other legislative instruments, if not already done, the principle of equality between women and men and ensure its effective application;
- b) enact and effectively implement appropriate legislative or regulatory measures, including those prohibiting and curbing all forms of discrimination particularly those harmful practices which endanger the health and general well-being of women;
- c) integrate a gender perspective in their policy decisions, legislation, development plans, programmes and activities and in all other spheres of life;
- d) take corrective and positive action in those areas where discrimination against women in law and in fact continues to exist;
- e) support the local, national, regional and continental initiatives directed at eradicating all forms of discrimination against women.

2. States Parties shall commit themselves to modify the social and cultural patterns of conduct of women and men through public education, information, education and communication strategies, with a view to achieving the elimination of harmful cultural and traditional practices and all other practices which are based on the idea of the inferiority or the superiority of either of the sexes, or on stereotyped roles for women and men.

(Protocol to the African Charter on Human and Peoples' Rights on the Rights of Women in Africa, article 2 "Elimination of Discrimination Against Women")

MODULE 4

4

MAINSTREAMING FGM/C PREVENTION IN DEVELOPMENT PROJECTS

Module objective

- To have an overview of the different approaches to programmes for the prevention and abandonment of FGM/C
- To understand positive and negative effects of different types of intervention for different target groups
- To suggest ways of mainstreaming FGM/C prevention actions into more general development projects and programmes.

Why this module?

First attempts to stop the practice

The first documented Western attempts to end FGM/C can be traced back to colonial administrations and missionaries of the early 20th century. Early-century colonialists adopted a cultural absolutist approach, opposing FGM/C practices on moral grounds. Local leaders passed laws and church rules in an attempt to curb the practice. These efforts had limited success, primarily confined to communities where Christianity had taken hold.

However, most communities reacted in anger to the foreign intervention into their customs. In Kenya, attempts to end FGM/C practices led to violent confrontations and fed into a larger nationalist resistance movement. In Sudan, attempts by the British colonial government to enforce a ban on infibulation resulted in rioting and destruction of a prison holding women arrested for violating the new law.

Throughout the middle of the century, the international community shifted to a cultural relativist approach, declining to pass judgment on the traditional practices of other cultures. In 1950, WHO declined to take a stand on FGM/C because the practice involved "operations based on social and cultural backgrounds" that should not be disturbed.

The international attention to FGM/C

WHO was the first international organization to take a public position against FGM/C, and by the 1970s, it was actively working to gather health-related information surrounding the practice. The 1979 Meeting on Traditional Practices Affecting the Health of Women and Children - held in Khartoum, Sudan - was the first international conference that specifically

addressed FGM/C. For the first time at an international forum, delegates voted to support efforts leading to the end of all forms of the practice. Hailed as a watershed event, this conference greatly influenced further discussions about FGM/C practices and brought the international community together to develop ways to end FGM/C.

GAMS, Groupe de femmes pour l'abolition des mutilations sexuelles (Women's group for the abolition of sexual mutilations), in France, was the first organisation officially dedicated to preventing FGM/C to be created in 1982. It was followed by the IAC, Inter African Committee on Traditional Practices affecting the Health of Women and Children, composed originally by 6 national committees and created during a conference in Senegal in 1984. Meanwhile, an increasing number of African women started to raise their voice against the practice.

The international conferences of the Nineties

By the early 1990s, activists were working to move FGM/C from a public health issue into the larger women's rights movement. In 1993 at the UN World Conference on Human Rights, the international community declared FGM/C a human rights violation. In 1994 at the UN International Conference on Population and Development in Cairo, Egypt, the Programme of Action urged governments to prohibit FGM/C wherever it is practiced and to actively support anti FGM/C campaigns conducted within their own countries. And, in 1995, the World Conference on Women held in Beijing, China, declared FGM/C a form of violence against women.

A critical analysis

Over the last twenty years, projects and programmes of FGM/C prevention have spread to almost all the African countries where it is present. The results of the DHS surveys, and the high rate of prevalence recorded and often reconfirmed in the second survey (such as in Egypt, Burkina Faso, Mali, Eritrea) have inspired a more critical look at this interventions, not only by international bodies such as WHO but also national development cooperation bodies and private institutions/donors.

In 1999, WHO published the results of a vast study, carried out by the NGO PATH, Program for Appropriate Technology in Health, with the aim of documenting the "status and trends in programming FGM/C prevention, and identify crucial elements for establishing priorities in assigning future resources." This analysis was meant as an "instrument of planning or a basis of comparison for monitoring evolution of efforts to eradicate FGM/C" for governments, non-governmental organizations and donors.

Using Senegal as a case study

Meanwhile a programme started in Senegal by the NGO TOSTAN has managed to have up to 1.300 villages in rural areas affirming through a Public Declaration their official decision to abandon FGM/C and early marriage. The "snow ball" effect, from the first villages to grouping of up to 300 villages declaring during the same ceremony, collectively, their decision to abandon the practice, is a phenomenon that deserves better attention, in order to understand if this action can in the long run bring to a definitive abandonment of the practice and if this model of intervention can be repeated elsewhere, where structure of society and culture are different.

This module aims at offering planners a closer and critical look at interventions taken so far, confronting them with the multidimensional nature of FGM/C, understanding the importance of appropriate research, monitoring and evaluation mechanisms, and promote creative programming in connection with the broader local and national development agendas.

Activities

Activity 1: Gender planning

Activity 2: Review of past approaches

Activity 3: Behavioural and social change models

Activity 4: Interaction between women and community:
the WECC

Activity 5: Programming framework

Total time: 3 hours and 45 minutes

Activity 1

4

BEHAVIOURAL AND SOCIAL CHANGE.

Time: 1 hour and 15 minutes

Why do this activity?

Over the past years, 'behaviour change' has entered the development jargon.

The 'behavioural' aspect of practising FGM/C is increasingly recognised. However, effective interventions for ending FGM/C do not only involve influencing personal behavioural. They also involve influencing social norms, values and customs as well as what we can term the 'behaviour of societies'. This is what we call 'social change'.

We believe that the processes of behavioural and social change are continual, non linear, porous and overlapping. And although, we may discuss them separately as theoretical constructs, in reality, we need to recognise how they trigger, influence and are influenced by each other.

Objectives

- To introduce the concepts of behavioural and social change.
- To identify the relevance of behavioural and social change concepts to the practice of FGM/C.
- Identify ways of using the concepts to design and monitor projects to end FGM/C.

How to do the activity

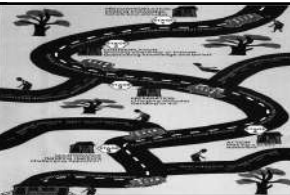

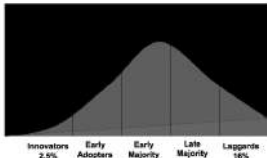

Step 1: 45 minutes

Presentation in plenary

The facilitator takes the participants through the Power point presentation on "FGM/C, behavioural and social change". The presentation attempts to define behavioural and social change. It also shows how these models of change are linked to FGM/C and more importantly how they can impact:

- a) Our understanding of FGM/C as a practice that has individual and social manifestations.

- b) How can we use these models of change in efforts to end FGM/C.
- c) How to use these models to develop specific project inputs

<p align="center">FGM/C, behavioral and social change</p>	<p align="center">Behavioral Change & FGM/C</p> <p>Attempts to outline: > The stages of behavioral change. > The process of behavioral change. > Interventions necessary to sustain a new behavior.</p>	<p align="center">Behavioral Change & FGM/C</p> <ul style="list-style-type: none"> • Why is understanding behavioral change important? • Presents a useful framework for designing interventions to end FGM/C • Presents a useful framework for evaluating/ measuring change. 					
<p align="center">Behavioral Change & FGM/C</p> <p>Characteristics of behavioral change related to FGM/C. • Target group for behavioral change are not those directly affected by the practice. • Decision to perform FGM/C is a complex process of group decision & power negotiation</p>	<p align="center">Behavioral Change & FGM/C</p> <p>Stages of behavioral change: • Pre-contemplation. • Contemplation. • Preparation • Action • Maintenance</p>	<p align="center">Stages of Behavioral Change</p> <p><i>Pre contemplation</i> The individual has not considered not circumcising the child.</p> <p><i>Contemplation:</i> The individual starts to question the practice. This is can be triggered by various factors: accident, increased knowledge, change in circumstances.</p>	<p align="center">Note to facilitator</p>				
<p align="center">Stages of Behavioral Change</p> <ul style="list-style-type: none"> • <i>Preparation:</i> Individual recognises FGM/C as a problem, and intends to make a decision not to circumcise the daughter. Starts preparing the scene to mitigate any real or perceived negative consequences. Step 2: 30 minutes

The exercise will lead to draw a representation of the group in terms of behavioural and social change in the shape of a bell figure.

Exercise in plenary

- Choose an innovation in consultation with the group. This may be an 'innovation' that is not necessarily related to social change. In fact, this is preferable (such as the introduction of mobile phones, but it can also be concerning abandonment of FGM/C...).
- Choose a facilitator from within the group to reflect the segmentation on the flip chart. The facilitator asks each participant, one by one, which is his/her position towards the innovation:

1. has he/her ever considered to adopt the new behaviour?
2. has he/her adopted the innovation immediately?
3. has he/her waited to adopt it that a significant number of other persons around him/her have done the same?
4. was he/her among the last one to adopt the new behaviour among his/her community?
5. is he/her resisting the adoption of the new behaviour?

Counting the answers received, develop percentages of the group in the different positions:

1. ...% of innovators
2. ...% of early adopters
3. ...% of early majority
- 4....% of late majority
- 5....% of laggards (resistors)

Using a flip chart, the facilitator develops a graph of the 5 segments of society derived from the group input.

Link the dots on the graph to arrive at the bell figure representing the group.

Invite people to consider this particular exercise while looking at a community where they foresee to introduce FGM/C prevention activities. Then distribute

Handout

Handout 1 "Understanding behavioural change",
 Handout 2 "Understanding social change",
 Handout 3 "Adoption of social change",
 Handout 4 "Road to individual behavioural change"
 Handout 5 "Stages in behaviour adoption"
 Handout 6 "The six stages of (individual or group) diffusion of innovation, or adoption process, applied to FGM/C"
 Handout 7 "FGM/C, behavioural and social change - Power point presentation"

for participants to read and keep as a reference for the programming exercise.

Materials

- Power point presentation
- LCD projector
- Laptop computer

- Handout 6: The six stages of (individual or group) diffusion of innovation, or adoption process, applied to FGM/C
- Handout 7: FGM/C, behavioural and social change – Power point presentation”

UNDERSTANDING BEHAVIOURAL CHANGE

Research into changing behaviour regarding FGM/C is still a relatively new concept. There are many theories and models of behavioral change from the fields of psychology, health education and communication, which contain elements relevant to the field of FGM/C. For an effective FGM/C intervention we strongly recommend using the trans-theoretical or “Stages of Change” model which presents a framework for integrating several key concepts and theories about human behaviour to explain how and why change occurs. It is also more suitable to measure behaviour change in a community and to evaluate the effect of an intervention in that community.

The stages of change model was originally applied in a study of smoking cessation by Prochaska and Diclementine (1983), but it has been used to study other areas including alcohol abuse, contraceptive use and psychological distress. It was first applied to the field of FGM/C by Izzett and Toubia (1999). It is based on a comparative analysis of major systems of therapy and includes three dimensions: change processes – activities that are used to modify behaviour, levels of change – the types of problems to be changed and stages of change – the phases people move through in changing their behaviour.

Behavioural change is very complex; a person may go through many different stages before reaching a sustainable new behaviour. Behaviour change can be an *individual* and/or a *group* process and is part of the larger process of social change. Other theories of health behaviour have also been used in health promotion. These include the health belief model; theory of reasoned action; social cognitive theory; diffusion of innovations and others.

Two **important characteristics** that distinguish the field of FGM/C to other frequently studied social behaviours are that: those whose behaviour is to change are not the individuals who are affected by the practice (i.e the young girls) and that the decision to perform FGM/C is either a group decision or the outcome of the balance of power among a group of individuals related to the child.

Information on the process that leads to a decision not to circumcise a girl and the actions needed to follow through are essential to design and formulate effective strategies to stop FGM/C. The five stages outlined in the Stages of Change Model – **precontemplation, contemplation, preparation, action and maintenance** – present a useful framework to study a person’s journey towards FGM/C abandonment. They also provide a way to monitor progress towards change.

Precontemplation: would represent a state where the individual had not even considered the possibility of not circumcising the daughter.

Contemplation: would be reached if something caused the individual (she or he) to question the practice. This might be through new knowledge gained as the result of an intervention or hearing about serious complications or death of a relative or neighbour’s daughter due to FGM/C. It is important to remember that for women who themselves are circumcised the contemplation or questioning phase will evoke memories and feelings towards their own circumcision experience. This may propel them forward towards stronger conviction to stop the practice or, alternatively, prove too painful to handle with a renewed state of denial setting in. As women’s personal experience of emotional and physical pain during the circumcision indelibly marks their mental map of their bodies (Johansen 2001) it may prove to be a determining factor in how women go through behavioural change towards the practice in

ways that are very different from men. We propose that for women the interplay between the intellectual and emotional in processing new information about the negative effects of FGM/C (cognitive dissonance) is greater than men (Toubia et al, 2002)

Preparation: would be reached when the mother (or any other influential member of the family) has considered all her thoughts and feelings and decides she does not want her daughter circumcised.

Action: the decision made must be stated or declared, for example, when relatives start talking about preparations for circumcising the child or during any other occasion. The declaration may be a **public declaration** of not circumcising the girl or **intent** not to circumcise the girl.

Maintenance: Opposition of the decision made would need to be managed, particularly from individuals with more social power in order to sustain “maintenance”. The maintenance stage is often very prolonged until the daughter is past the risk of circumcision which might not necessarily be age dependant. (Refer to the previous essay of age range in Section 3). The most common marker of the end of the risk of circumcision is marriage but, for an emerging minority of modern women, it is employment and economic and social independence. However, at any time the decision that has been made might be over-ridden by a more powerful family member, often a grandmother, and the daughter is circumcised.

It is also crucial to identify accurately the individual’s stage of change so that an intervention based on stage specific processes of change can be applied. The stages of change model proposes that efforts to bring FGM/C abandonment that assess and take into account the stage at which the individual is in before the intervention will be much more effective and efficient than an intervention which does not take this into account.

The journey towards change can be a long and winding road. As we travel along the road there are often new items of information, personal experiences, peer approval and societal influences, which can move progress either forwards or backwards.

In adapting this model to the study of behaviour change for FGM/C, programme staff conducting the intervention need to learn what will **encourage** people to move forwards along the road, and what the potential **barriers** may be. While it may not be possible to explain behaviour completely, by studying the different influences on the journeys that individuals make in coming to a decision to stop circumcising girls would be of great importance in identifying commonalities and differences across societies and cultures and hence facilitate comparative studies, research and interventions.

UNDERSTANDING SOCIAL CHANGE

Perhaps the first point that we need to recognize about social change is that it is a cumulative, complex *process* that happens **all** the time and can be, more often than not, imperceptible.

“The term social change could apply to modifications in social cultural relationships. All societies are involved in a process of social change; however, this change may be so slight that the members of the society might hardly be aware of it”. (Christine Preston, 2000).

“Social change is a complex phenomenon which is non-linear and encompassed in various levels of social life; it is because the whole of social life is continually changing. What differs is the rate of change.” (Lauer R 1976).

As an example, in a community an individual’s behaviour with regards to FGM/C might change more or less quickly than in the relevant social institution. That discrepancy will measure the differing rate at a given point of time and not that there has been a change or not.”

From much of the literature on social change it is not easy to extract a clear definition of the concept. *Social change* is explained much more extensively in both the sciences of sociology and psychology. Most definitions available for social change define it in very broad terms. But for our purpose, what do we mean by *social change*?

Social change is both normal and continual. The important questions to ask relate to the direction and rate of change at various levels of social life. Some disputes about change occur because people forget about the various levels and the differing rates. For some, there is no change, or at least no significant change, until the institution itself has changed. For others, even changes in attitudes and behaviour reflect significant alterations in social life.

It is important to remember that behavioural change may or may not lead to or reflect changes in interpersonal relationships, organisations, or institutions. Or there may be a time lag involved, with changes at one level occurring more slowly than changes at another.

Diffusion of Innovations Theory

The theoretical framework described here on how a new idea spreads through society comes from the work of Everett Rogers and co-workers over the past thirty years.

Diffusion is the process by which an **innovation / idea** is **communicated** through certain **channels** over **time** among the members of a **social system**. The diffusion of Innovations Model treats change like a wave passing through society. It looks at the way innovations are taken up by a population.

The Innovations Diffusion framework provides a description of the different audience segments that help to establish specific strategies to meet their needs for information and skills.

Defining the Four main elements in the Diffusion of Innovations Model:

Innovation: An idea or a new practice that is perceived as new by its audience.

Communication channels: The means by which messages get from one individual to another

Time: Rate of adoption of the innovation

Social System: A set of interrelated units engaged in joint problem solving to accomplish a common goal

The six stages (individual or group) of Innovation Diffusion, or adoption process:

Given that decisions are not authoritative or collective, each member of the social system faces his/her own innovation-decision that follows a six step process.

1. **Attention** (awareness) - exposure to its existence
2. **Interest** development, persuasion - forming of a favourable attitude towards it
3. **Evaluation** – the pros and cons of the idea are compared
4. **Trial** - made to adopt or reject the idea, *commitment* to its use
5. **Adoption** - putting it to use
6. **Confirmation - reinforcement** based on positive outcomes from it.

Strategies to move the Adoption Process Forwards

At each of these steps of the 'Life Cycle' there are strategies that can be used to push the process along. The strategies are most successful when they address these elements of the new idea introduced:

1. **Attention:** Use of mass media
2. **Interest:** Emphasise the relative advantage of the innovation
3. **Evaluation:** Show compatibility with existing values, needs and past experience
4. **Trial:** Present 'innovation' in simple way, understandable, and easy to try
5. **Adoption:** Modify the 'idea' to individuals' needs
6. **Confirmation:** Emphasise and show the positive results of the innovation

Adopter categories on the basis of Innovativeness

Not all individuals in society adopt an innovation at the same time. Diffusion researchers tell us that for any given behaviour, individuals adopt in a time sequence and could be broken down into 5 segments, based on their propensity to accept the new idea or behaviour.

While an individual might be an early adopter with respect to one idea, he could be a late adopter with respect to another. Therefore, people can be categorised as a type but only with reference to a particular idea.

Adoption begins with visionary, imaginative *innovators*, which later attract the experimental *early adopters*, and eventually sweep in the *majority* audiences with the *sceptics/laggards* who are holding out to the bitter end and see no urgent reason to change.

Usually, the early adopters are characterised as opinion leaders, respected by the community and ones who watch and analyse things, but this is not always necessarily the case. See Table 1 for an example of some of the characteristics.

Table 1: Examples of Key Characteristics of Adopters

Segment	Key characteristics
Innovators	<ul style="list-style-type: none"> • venturesome, risk takers • eager to try new ideas • are mobile, and communicate outside local peer networks • have ability to grasp abstract ideas • easily reached by communication networks • can cope with the uncertainty associated with an innovation • require a shorter adoption period.
Early adopters	<ul style="list-style-type: none"> • are a more integrated part of the local social system • have the greatest degree of opinion or social leadership with a group • respected by society and thought by others to be successful • potential adopters look to early adopters for advice and information • serve as a role model for many other members of the social system • they reduce uncertainty about a new idea by adapting it

Segment	Key characteristics
Early Majority	<ul style="list-style-type: none"> • they adopt ideas just before the average member of the social system • get their information from early adopters • often interact with peers, but seldom hold leadership positions • are an important link in the adoption process • usually deliberate before adopting a new idea
Late Majority	<ul style="list-style-type: none"> • adopt new ideas just after the average member of a social system • adoption usually in response to increasing peer pressure • approach to new ideas is sceptical and cautious • worry about how the new idea will affect them • almost all uncertainty about a new idea must be removed before the they feel it is safe to adopt
Late adopters	<ul style="list-style-type: none"> • are the last in the social system to adopt an innovation, therefore are isolated • tend to be frankly suspicious of innovations and new ideas • their adoption lags far behind awareness of a new idea

Always remember, these characteristics are not fixed and people can move across categories.

1. It used to be assumed that the mass media had direct, immediate, and powerful effects on the mass audience. But the diffusion theory argues that a powerful way to affect the diffusion of an innovation is to affect opinion leaders' attitudes, through one-to-one support. Mass media is important however:

- iii. When there is a need to spread knowledge of an innovation to a large audience
- iv. To change weakly held attitudes

2. Support early adopters: Contacting early adopters is often easy as they will come looking for you. But the challenge is to provide the one-to-one support that early adopters expect and the recognition they need.

3. Win mainstream credibility: most projects fail to make the leap from experimental (pilot) to mainstream. Reasons for this are:

- V. Mainstream audiences do not like risks;
- VI. require endorsement from conservative leaders
- VII. require positive results
- VIII. depend on word of mouth promotion

For an example of how to reach some of the categorised segments of a society see table 2 below.

Table 2: Approaches to Reach Different Segments

The segment	The approach to reach the segment
Innovators lead the way for others. They have already personally adopted the new behaviour.	<ul style="list-style-type: none"> • Media sources. • Directly involve innovators in the design of the programme through Participatory Planning. • Recruit and train the innovators as the peer educators (promoters.)

The segment	The approach to reach the segment
Early Adopters are open to new ideas that provide personal benefit. They are fashion setters, may have big egos and need a lot of personal support.	<ul style="list-style-type: none"> • Inter-personal contact • Addressing concerns. • Step by step guidance to experiment with the idea. • Strong face to face support with a limited number of early adapters to try out the practice. • Reward the participants ego through media coverage. • Maintain strong relationship with this group through regular feedback.
Early majority will only act when they get adequate proof of benefits. They are pragmatists, will accept simple, proven new ideas. They will adopt when there is minimum discontinuity with the lifestyle they are used to.	<ul style="list-style-type: none"> • Media stories featuring endorsements from credible individuals, opinion makers. • Provide one to one support discussing concerns, and consequences.
Late Majority do not like taking risks, or new ideas, but also do not want to be left behind, hence will follow the mainstream and the established standard. They can also be influenced by the sceptics	<ul style="list-style-type: none"> • Refine your new idea to increase convenience and reduce untoward consequences. • Respond to the criticism from sceptics.
Laggards/ Late Adopters will block progressive change. Take their arguments seriously, as they often identify real problems that need to be solved before the majority segment can accept the innovation	<ul style="list-style-type: none"> • Actively enforce regulations • Publicise prosecutions

The Convention Model

The Convention Model, adopted by Schelling and Lewis in the early 60's proposing that what is seen as a norm is a convention, with the convention being considered as a behavioral regularity such that everyone conforms to the regularity, expecting others to conform, and wants to conform given that others conform.

Using the theory of the convention model, Mackie in 1996, tried to explain the relation between FGM/C and foot binding to the convention model. He explains that FGM/C is perceived in the community as the norm, thus all families will perform the act, "what one family chooses depends on what other families choose". According to him, if one family gives up the practice, this will affect the marriagability of their daughter, but if a critical mass is reached where families pledge to not practice FGM/C, then what becomes perceived is that this is the norm, and this makes it become part of their own interest to keep their pledges, such as what occurred in Malicounda Bambara village, Senegal, through the TOSTAN program.

Mackie also uses the convention model to explain how footbinding in women ended in China, he relates it with the convention model, that what was once a universal act performed to most of the community was abandoned. This he explains through the following activities undertaken by the anti-footbinding reformers:

1. Carrying out an education campaign
2. Provision of new information about health consequences
3. Formation of natural foot societies whose families pledged not to bind their daughters feet nor to let their sons marry women with bound feet

Unfortunately the convention model still does not provide a clear explanation on what the mechanisms were that made the change and the shift from a social change into a social movement, such as the ending of footbinding in China by 1911. But according to different historical accounts, there were underlying factors which also assisted the abandonment of the practice of footbinding to occur, including:

- The women's modern education movement during Mao's social revolution (1900-1911)
- The women's physical emancipation movement (which was closely connected to patriotism and nationalism)
- The need for physically fit women, due to China being under attack (and the strong limitation of footbinding to movement)

All in all, the book makes the case that it is not significant factors that have the power to change, but rather identifying small alterations in the environment can initiate change in behaviour. Eg removing graffiti from the New York Subway was one of the Tipping points in the decline of crime in New York,

Please note that while every effort has been made, the list of theories provided in the handout is by no means comprehensive. More research is needed & will hopefully be undertaken by different organisations in this respect. We are hoping to be able to capture & analyse this new research in a future work.

ADOPTION OF SOCIAL CHANGE

The Rate of Adoption is influenced by the degree to which the new idea is perceived as offering an advantage over the presently held idea and the degree to which the new idea is compatible with individual's present beliefs.

The average rate of adoption varies greatly according to the 'innovation' and the individuals concerned.

New ideas (innovations): that are relatively simple in nature, easy to try, and compatible with previous experience are usually adopted more quickly than innovations that lack these characteristics.

Therefore innovation-decision is made through a cost-benefit analysis, where the major obstacle is uncertainty. People will adopt an innovation if they believe that it will, enhance their utility. Analysis would depend on the degree to which the innovation would disrupt the functioning of their daily life.

Individuals: early adopters have a shorter adoption – decision period than late adopters. Thus the first individuals to adopt a new concept, or idea, do so not only because they become aware of the innovation somewhat sooner than their peers, but also because they require less time to move from knowledge to decision.

A striking feature is that for most members of the social system, the innovation-decision, depends heavily on the innovation-decisions of the other members of the system.

Once an innovation is adopted by 20% of the population, it is virtually unstoppable and a relatively rapid adoption will occur by the remaining members.

Past research has shown that the adoption of an innovation follows a bell shaped curve, when plotted against time. The curve of adoption rises slowly first when there are few adopters. It then accelerates to a maximum until half of the individuals in the society have adopted. It then increases at a slower rate as the remaining individuals finally adopt (See figure 1 below)

Figure 1: The Adoption Curve

According to Rogers, word of mouth is the most important method for adopting new ideas. Innovators get their information from media sources. Starting with early adopters, word of mouth takes on more significance

Designing successful interventions

Knowing the mechanisms of diffusion gives us a basis for considering what efforts are most successful in encouraging the spread of an innovation.

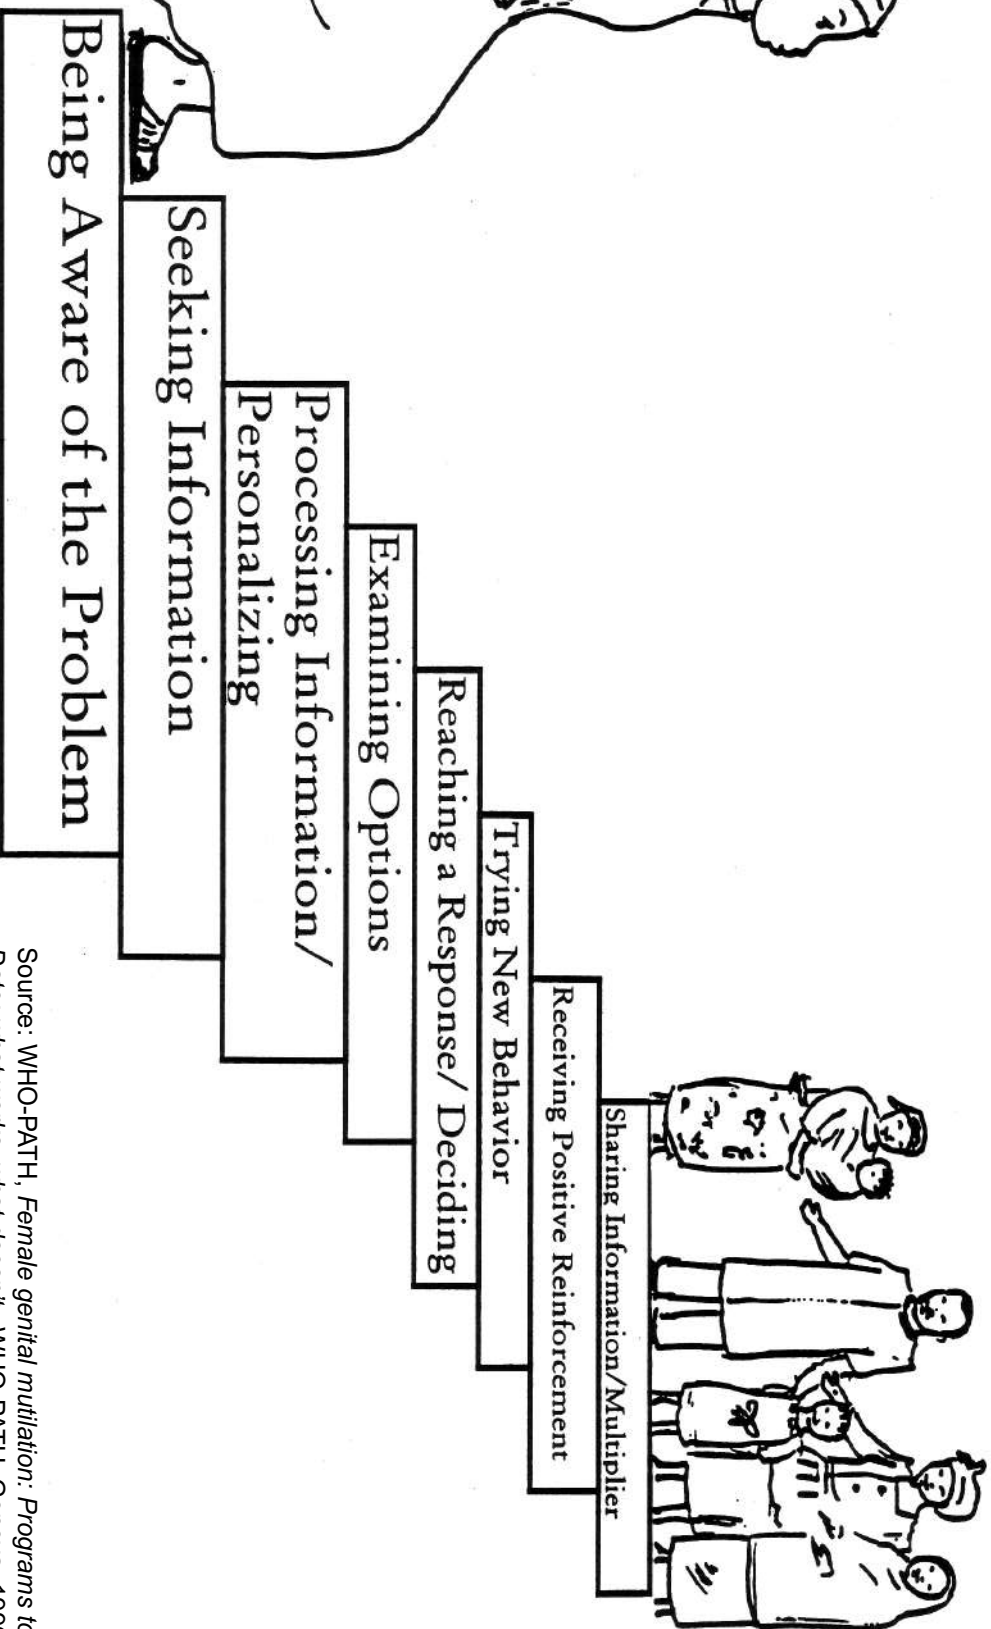

Why do certain innovations spread more quickly than others? Why do others fail altogether?

The rate of adoption of an innovation depends on the **characteristics of the innovation** (as perceived by the audience)

- i. Relative advantage
- ii. Compatibility with existing values and practices
- iii. Simplicity and ease of use
- iv. Whether it has been tried previously by others.
- v. Observable results

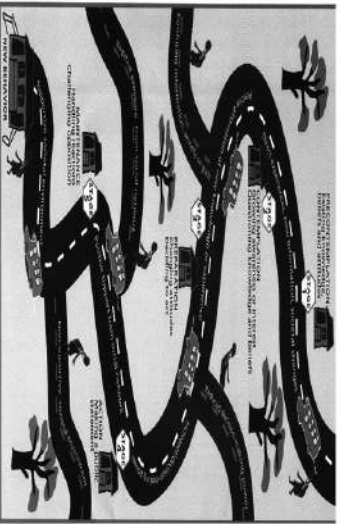

STAGES OF BEHAVIOUR ADOPTION

Source: WHO-PATH, *Female genital mutilation: Programs to Date: what works, what doesn't*, WHO-PATH, Geneva, 1999

The six stages of (individual or group) of Innovation Diffusion, or adoption process, applied to FGM/C

Stage	What happens at this stage	Strategies to move the adoption process forwards
<i>Attention</i>	Awareness, exposure to the 'innovation': the possibility of abandoning FGM/C.	Use of mass media to channel the idea that abandoning FGM/C is possible
<i>Interest</i>	Development, persuasion - forming of a favourable attitude towards the abandonment of FGM/C.	Emphasise the relative advantage of the abandonment of FGM/C
<i>Evaluation</i>	The pros and cons of the idea are compared.	Show compatibility of abandonment of FGM/C with existing values, needs and past experience
<i>Trial</i>	Made to adopt or reject the idea, leading possibly to a commitment to its implementation.	Present this 'innovation' in simple way, understandable, and easy to try
<i>Adoption</i>	The new behaviour is adopted.	Modify the 'idea' to individuals' needs
<i>Confirmation - reinforcement</i>	...based on positive outcomes from it.	Emphasise and show the positive results of the innovation.

<p style="text-align: center;">FGM/C, behavioral and social change</p>	<p style="text-align: center;">Behavioral Change & FGM/C</p> <p>Attempts to outline:</p> <ul style="list-style-type: none"> ➢ The stages of behavioral change. ➢ The process of behavioral change. ➢ Interventions necessary to sustain a new behavior. 	<p style="text-align: center;">Behavioral Change & FGM/C</p> <ul style="list-style-type: none"> • Why is understanding behavioral change important? • Presents a useful framework for designing interventions to end FGM/C • Presents a useful framework for evaluating/ measuring change.
<p style="text-align: center;">Behavioral Change & FGM/C</p> <p>Characteristics of behavioral change related to FGM/C.</p> <ul style="list-style-type: none"> • Target group for behavioral change are not those directly affected by the practice. • Decision to perform FGM/C is a complex process of group decision & power negotiation 	<p style="text-align: center;">Behavioral Change & FGM/C</p> <p>Stages of behavioral change:</p> <ul style="list-style-type: none"> • Pre-contemplation. • Contemplation. • Preparation • Action • Maintenance 	<p style="text-align: center;">Stages of Behavioral Change</p> <p><i>Pre contemplation</i> The individual has not considered not circumcising the child.</p> <p><i>Contemplation:</i> The individual starts to question the practice. This is can be triggered by various factors: accident, increased knowledge, change in circumstances.</p>
<p style="text-align: center;">Stages of Behavioral Change</p> <ul style="list-style-type: none"> • <i>Preparation:</i> Individual recognises FGM/C as a problem, and intends to make a decision not to circumcise the daughter. <p>Starts preparing the scene to mitigate any real or perceived negative consequences. Activity 2

4

REVIEW OF PAST APPROACHES

Time: 1 hour and 30 minutes

Why do this activity?

Since the international involvement in the campaign against FGM/C started over 20 years ago, marked by the World Health Organization sponsored conference in Khartoum in 1979, interest in this issue has increased progressively. Policies were announced and projects were funded to target the practice, but little investment was made to guide these policies and projects with evidence-based information. The involvement of different actors in different countries with varying assumptions and values resulted in the development of diverse approaches for the abandonment of the practice. Only recently has attention started to be given to objectively evaluating these approaches and their outcomes.

This process started after the publication of the results of the first Demographic and Health Surveys (DHS) including data on FGM/C, showing impressive high rates of prevalence also in countries where FGM/C prevention activities were carried out for a long period of time (such as Mali, for ex.). In 1999, WHO published the results of a vast study, carried out by PATH, Program for Appropriate Technology in Health, with the aim of documenting the “status and trends in programming FGM prevention, and identify crucial elements for establishing priorities in assigning future resources”. The fundamental question was:

Can such an old and deeply entrenched cultural practice be stopped? Many scholars and activists answer this question by “an unequivocal yes”: FGM/C is no longer a taboo issue, there is evidence of decrease of support as well as of prevalence, with local quality research sometimes offering more encouraging results than the large scale DHS.

But it is evident that some approaches work, or at least have worked in the past, and some others don't.

This activity is aimed at learning about the different approaches to FGM/C prevention activities, in order to choose the most appropriate for designing interventions in different settings.

Objectives

- To obtain an overview of the different approaches for prevention of FGM/C
- To identify positive and negative aspects of different approaches

- To understand which approach is better suited for a specific target group, area of intervention, type of FGM/C.

How to do the activity

Step 1: 15 minutes

Put up the Overhead 1 “Why the practice of FGM/C continues: A Mental Map” and explain it.

This mental map has been developed by WHO and PATH for their first evaluation of projects and programs to prevent and stop FGM/C. This mental map synthesizes what has been learned in the previous module about the multidimensional nature of FGM/C, involving a number of “myths, convictions, values and codes of behavior [that] lead an entire community to see women’s outside genitals as potentially dangerous which, if not eliminated, have a negative effect on the woman who did not undergo the practice, her family and the entire community. In order to ensure that people respect the practice, the community has set powerful system of persuasion in motion, including refusal of the non-excised/infibulated woman as a wife, the risk of immediate divorce of wives who prove to be intact, public derision and the threat of public excision at the moment of marriage, the instillation of ancestral fears of possible risk. While circumcised girls are given gifts, public recognition, the possibility to marry, respect and entrance into the community of adults”.

Explain that according to WHO and PATH, as well as to number of activists and researchers, the reason while the prevalence is still high, is that programmes implemented since have failed to efficiently address this “mental map”. Ask group for comments:

- Is the mental map complete?
- What should be added?
- Are there additional elements to consider? Which ones?
- Does the mental map reflects opinions by all actors involved in the decision making process about subjecting a girl to FGM/C?

According to results of the discussion write eventual suggestions on the flip chart.

Step 2: 15 minutes

Put on Overhead 2 “Women and gatekeepers” and referring back to “mental map” analyse the drawing together with participants:

- At the centre of change concerning FGM/C there are women and girls, those who are submitted to and take the first decision in perpetuating the practice.

- Their freedom of movement within the community is regulated by the so called “gatekeepers” that use FGM/C as a key to open the doors. These are the men, the village leaders including the elders and the

**Note to
facilitator**

**Plenary
Overhead**

**Note to
facilitator**

circumciser, the religious leaders, and the other women (relatives, elders, peers).

- Each of them uses a different “Community enforcement mechanism” (refer to the Overhead “Why the Practice of FGM/C continues: A Mental Map”) to make sure that women adhere to the practice, offering in exchange the key to open the gate.

- Outside, women may find supporters, those starting a dialogue that might lead to threatening the “tradition” and trigger a process of behavioural change (or women’s empowerment).

- Finally, at the outer lever, there is society at large: those who build the environment allowing for a change in behaviour to take place, e.g. by adopting laws and policies that empower women, or by promoting girls’ enrolment in higher education, or by providing adequate reproductive health counselling services. This is a sort of “indirect” influence, or entry point, that might be very important in a programme addressing a sensitive and multifaceted issue like FGM/C.

Step 3: 30 minutes

Buzzing

Divide participants in pairs of two. Distribute to each pair one of the approaches listed in Handout 1 “Approaches to FGM/C prevention”, previously cut off (note that there are 10 approaches in total, so you should have maximum 10 couples to analyse them).

Distribute also Handout 2 “Questions to guide past approach analysis and presentation”, and read them out to explain how to carry on the exercise:

Does the selected approach addresses...

1. ...the **traditional arguments** given for perpetuating the practice (myth, religion, hygiene and aesthetics, rite of passage to adulthood)
2. ...the **psycho-sexual and social reasons**, including maintain chastity/virginity, control over women’s sexuality, male sexual pleasure etc.
3. ...the **community enforcement mechanisms**, such as refusal to marry uncircumcised women, peer pressure, rejection by community etc.
4. Does the selected approach involves the **different key actors** participating in the decision making process concerning FGM/C performance on girls?

Plenary discussion

Step 4: 30 minutes

Invite each couple to share their analysis: briefly explain which approach they have considered, then how they have responded to the questions. Invite others among participants to share their views and comments.

Handout 3

To conclude

Distribute Handout 3 “Past approaches in synthesis”. Ask if among participants there is somebody who has been part of an activity including the presented approach and likes to share his/her experience.

Does the experience confirm understanding by the group?

Materials

Why the Practice of FGC Continues: A Mental Map

Source: Asha Mohamud, Nancy Ali, Nancy Yinger, World Health Organization and Program for Appropriate Technology in Health (WHO/PATH), *FGM Programs to Date: What Works and What Doesn't* (Geneva: WHO, 1999): 7.

APPROACHES TO FGM/C PREVENTION

The Harmful Practices Approach. Involvement of medical and paramedical personnel (obstetricians, nurses, social workers and other local professionals) in providing information on the health risks connected to the practice, both immediate and long term ones. The idea is that this kind of information will automatically lead to abandonment of the practice, once the seriousness of short- and long-term health risks is fully understood. This approach was and is extensively used in awareness raising activities by agents of local NGOs and CBOs (community based organizations) in villages, with groups including women, village leaders, youth.

Training of medical personnel as “promoters of change”. This came out of the consideration of the multiple role played by medical personnel in developing countries with respect to the practice. If, on a personal level, every doctor is called on to resolve the conflict caused by membership in an ethnic group where FGM/C is practiced with respect to WHO prohibition, at the community level, the physician also plays other roles. It is the doctor to whom the family first turns in the case of complications from an excision or infibulation or the women/couple in the case of problems, especially in sexual relations frigidity/sterility, that might be the result of the practice. This is a very important, fertile moment of contact with the community. Having what is recognized as “superior” training, the physician ends up in the role of opinion leader, which puts him in the best possible position for promoting change of behaviors in his/her patients.

Alternative income generating activities for traditional practitioners. After sensitization towards the dangerous consequences of the practice and related risks, the programmes aim to substitute the practice of FGM/C with other income-generating activities — agricultural production, food processing, crafts, trade. To this end they foresee appropriate professional training for the former traditional practitioners, as well as a credit scheme providing funds for the start up of the chosen activity. This approach was adopted in a number of countries, especially in Western Africa (Guinea, Ghana, Mali, Burkina Faso) and in Ethiopia.

Alternative rites of passage. This specific actions has been designed and used in particular in Kenya by Maendeleo Ya Wanawake Organization (MYWO) as a key element of a community based approach aimed to raise awareness of the human rights and health implications of FGM/C, and to involve peer educators, teachers, religious and community leaders in mobilizing for social change. The alternative rite of passage was built on an existing rite of passage that is common for girls in some ethnic groups in Kenya where circumcision is part of a process to mark girl's coming of age and prepare her for marriage. The alternative rite of passage promotes positive aspects of culture and passing on of traditional wisdom while educating girls about sexuality, HIV/AIDS, relationships and family life. It culminates in a celebration of the girl's altered social status as a young woman. For girls and their families who have decided against circumcision, the program provides social support to offset the stigmatization that commonly occurs to those who don't follow conventional norms. A similar approach has been recently implemented by BAFROW in The Gambia, with a focus on women as central decision makers for their daughters circumcision. The alternative rite of passage was organized at the end of a 2 years community based literacy course focusing in reproductive health and women's participation.

Awareness raising through use of IEC materials. IEC stands for Information, Education, Communication and is very common in first generation programs aimed at raising the veil that hides the practice, stimulating an open debate in society and promoting different behavior on the basis of new information made available. There are a number of studies comparing the production of posters, brochures, leaflets, stickers, and colored table to arouse debate, anatomic models (this approach is adopted mainly by the IAC national committees) and analyzing the messages, graphic design and contents. On the basis of this analysis, WHO lists the most common messages, including the following:

- FGM/C has a negative affect on the health of women and girls
- FGM/C is a harmful practice
- use of the same knife can facilitate contagion with HIV/AIDS
- FGM/C violates the rights of women and girls
- FGM/C is not required by Islam
- a non-excised girl is a good wife
- FGM/C does not prevent sexual promiscuity
- FGM/C reduces female sexual pleasure
- FGM/C is contrary to Christian teaching
- Since the age when excision is practiced is constantly lowered, FGM/C can not longer be considered a rite of passage into adulthood

Involvement of religious leaders. This is an essential element of local programmes, as the conviction that FGM/C is a religious obligation is widespread. It is therefore not enough to state that neither the Quran nor the Bible require FGM/C. They have to be the first ones to abandon the practice (in the case of Imam or Protestant ministers with daughters) and must not tolerate further use among their congregations. For that reason, they need the proper theological knowledge to motivate their own choices, answer questions and doubts, support the individual decisions to abandon the practice made by isolated families and guide the entire community towards a future without FGM/C.

Positive deviance. This is the name given to an approach that underwent systematic experimentation in Egypt by the Center for Development and Population Activities (CEDPA) but actually an integral part of all those programmes that intervene at the village level, first engaging a few individual who, when conquered for the cause, promote a change of behavior within their communities, for whom they become a model of behavior. The experiment in Egypt was aimed first of all at identifying people who had already abandoned the practice, the “positive deviant”. Their motivation, the process followed to reach the decision, the way they resisted community pressure and stuck to the choices made were then the subject of an in-depth qualitative study that revealed the strategies for abandonment developed within the cultural context. Later awareness raising activities within the community were developed in accordance with the study result. The second phase of the project identified girls at risk (at the age for FGM/C intervention). The positive deviants formed small groups and contacted the families of the girls at risk, gained their trust and gradually induced them to reconsider their decisions regarding FGM/C. The challenge is to preserve this status at least until the girl is married: if the husband does not insist that she be excised/infibulated before marriage, it is rare for the practice to be carried out afterwards.

QUESTIONS TO GUIDE PAST APPROACH ANALYSIS AND PRESENTATION

- 1 ...the **traditional arguments** given for perpetuating the practice (myth, religion, hygiene and aesthetics, rite of passage to adulthood)
2. ...the **psycho-sexual and social reasons**, including maintain chastity/virginity, control over women's sexuality, male sexual pleasure etc.
3. ...the **community enforcement mechanisms**, such as refusal to marry uncircumcised women, peer pressure, rejection by community etc.
4. Does the selected approach involves the **different key actors** participating in the decision making process concerning FGM/C performance on girls?

PAST APPROACHES IN SYNTHESIS

- 1. The harmful traditional practice:** providing information on the health risks connected to the practice, both immediate and long term ones, with the idea that this kind of information will automatically lead to abandonment of the practice, once the seriousness of short- and long-term health risks is fully understood.
- 2. Training of medical personnel as promoter of change,** as they may use the particular moment of medical consultation to persuade their patients about the need and importance of abandoning the practice, given the authority these professionals have in the community generally.
- 3. Alternative income generating activities for traditional practitioners:** train excisors in other income generating activities and offer them economic support to start their new businesses, in order to substitute the income they earned through FGM/C performance and have them lay down their knives.
- 4. Alternative rites of passage,** also defined as initiation without cutting, foresees a preparation period during which the “good” aspects of culture and tradition are taught to the girls and then a public ceremony with planting trees or other symbolic acts, instead of cutting.
- 5. IEC materials to raise awareness:** Information, Education and Communication materials were widely used in both rural and urban settings to stimulate a debate about the need to abandon the practice, with the idea that the awareness raised would have lead to this result.
- 6. Involvement of religious leaders** to confirm that FGM/C is not a practice required by Islam or any Christian religion, and to counter the quite widespread belief that it is necessary to be pure, pray etc.
- 7. Positive deviance:** it engages first a few individuals who, once conquered for the cause, promote a change of behavior within their communities, for whom they become a role model for having dared to deviate from tradition for what is defined as a more positive future for their daughters.
- 8. Human rights approach:** It is aimed at making people understand, even in practicing villages, the fundamental human rights of people, women and children in particular, the advantages derived from them and how FGM/C is a manifest violation of these rights.
- 9. The legal approach** aims at obtaining laws that prohibit or otherwise prevent the practice. It foresees as well advocacy for their implementation, where appropriate.
- 10. The comprehensive social development approach:** In order to overcome limits emerged by addressing exclusively the negative health consequences of FGM/C and focusing merely on health personnel as well as circumcisers (the performers of the act), this approach calls for addressing all aspects of development, including gender issues as well as social, political, legal, health and economic development of a community.

Activity 3

4

PROGRAMMING TOOLS TO MAINSTREAM FGM/C

Time: 1 hour

Why do this activity?

This activity builds on two methods for programming, in particular:

- a) gender planning
- b) the WECC (Women's empowerment community consensus) model

to learn how to best mainstream FGM/C prevention into development programmes.

In fact, the analysis carried out during the previous modules has brought to the conclusion that FGM/C will come to an end when women themselves feel that they can abandon the practice without losing what the practice guarantees to them: survival and security through marriage, reproduction and social recognition for their children, dignity and an accepted social role, including freedom of movement and some decision making.

The "gender spectacles" we have put on during this training course will allow us to recognize the "practical gender needs" as well as the "strategic gender needs" that crosscut with FGM/C. This in turn will permit to identify target groups, objectives, appropriate messages, and follow them up through the different "stages of behavioural change", understanding which are the necessary interventions, resisting adverse pressure, and arrive to the point where the whole community have reached a consensus on the abandonment of FGM/C, and make it public through some sort of "Declaration", as the methodology used by the Senegalese NGO TOSTAN shows.

The programme should be designed in order to build the supportive social and cultural environment that is necessary for women and families to adopt a different behaviour: ingredients for this environment include information through the media as well as policy and laws. Moreover, the proposed method will help to identify activities to be implemented in order to uphold the decision to abandon the practice, and to allow a smooth transition to a new collective behaviour.

Objectives

- To understand how to use the learned skills for effective program-

ming, including “gender planning”, “stages of behavioural and social change” and the “WECC model”.

- To identify the linkages between women’s empowerment programmes and FGM/C prevention programmes
- To define concrete steps to mainstream FGM/C prevention activities into different development programmes in order to bring about a long lasting behavioural change.

How to do the activity:

Step 1: 1 hour

The facilitator leads the group through the Power Point presentation on “Programming tools to mainstream the abandonment of FGM/C into development programs and projects”.

Power point presentation in plenary

<p>Programming tools to mainstream the abandonment of FGM/C into development programs and projects</p>	<p>What have we discovered?</p> <ul style="list-style-type: none"> women work more hours than men women’s work is largely not paid (valued) women work to reproduce life, through childbearing and household chores women do not have leisure time women do not control resources, although they might have access to them women are meant to satisfy men’s sexual desire women gain dignity, social recognition, freedom only through marriage, facilitated by FGM/C 	<p>Which role does FGM/C play?</p> <ul style="list-style-type: none"> empowers women, giving them access to marriage leading to social mobility gives men greater control over women, through the denial of women’s sexuality reinforces existing community power institutions (elders, circumcisers) plays an economic role, as it promotes exchange of wealth (payment to circumcisers/elders, gifts and presents, future bride price) gives women access to resources (water, earnings through work on husband’s fields...) is an identity marker 	<p>Which are the development priorities for women/communities?</p> <ul style="list-style-type: none"> poverty / economic security: earning more, access to and property of land, paid job education children’s wellbeing (present and future) family planning (birth spacing) prevention of HIV/AIDS healthcare (general) mobility water and sanitation ...

Expand room for manoeuvre / WECC</p> <ul style="list-style-type: none"> choose development areas where gender equality / women’s empowerment will benefit the whole community choose areas where FGM/C is perceived as a power gaining tool for women build supportive structures / institutions for women’s empowerment including full participation of women .../...
<p>5. Expand room for manoeuvre / WECC cont.</p> <ul style="list-style-type: none"> choose appropriate message / WECC inputs work with supporters (assets) to move resistors (constraints) towards different stage move to collective decision making: public declared intent to change behaviour...public declaration to abandon FGM/C build a sustainable environment for change (where new gender roles and power dynamics, including abandonment of FGM/C, can be maintained) 	<p>6. Conduct progressive monitoring</p> <ul style="list-style-type: none"> look at women’s empowerment without FGM/C: do women gain power over/to/with/in a different way? use quantity/quality data/information gathered through gender/situational analysis as a baseline: what changed in the community after intervention? look at social change: which changes in stages of behaviour of target groups happened? identify unexpected results: where there positive and/or negative unforeseen outcomes? define new working objectives/entry strategy define how to scale up activities 		

Note to facilitator on how to present

Please, note that the lists on **slide 1, 2 and 3** are purely indicative: it could be wise to add comments from participants, before showing the content of the slide, asking the title questions and writing the answers on a flipchart. Some of the answers might coincide with the proposed answers on the slides, some will be different, according to local situation. Each list will then be shown only as an indicative reference.

As many program officers might already be familiar with the **gender planning methodology**, when it comes to **slide 5**, ask participants first to define “practical gender needs” and “strategic gender needs”. Then focus more in detail on the “strategic gender needs” with **slide 6**, eventually again asking participants to define them more in detail.

When it comes to **slide 11 on Prioritisation of development problems with a gender perspective**, invite participants to do the **prioritization of problems** imagining a community that all are familiar with, shortly describing the condition of women there and then asking the questions:

- WHY is that particular problem there?
- what is its impact on women?
- which are its causes?
- does FGM/C play a role in it?
- if yes which one?

To conclude

Handout

At the end, explain that this programming tool is the result of the fusion of two different methodologies: gender planning, a methodology developed at the Development Planning Unit of the University of London by Caroline Moser and her colleague and co-trainer Caren Levy. The whole methodology, which has been here synthesised to its essential steps and applied to the specific field of FGM/C as a development issue, has been presented in Caroline Moser’s book *Gender planning and development. Theory, practice & training*, first published by Routledge in 1993; WECC, the Women’s empowerment and community consensus framework developed by RAINBO on the basis of behavioural and social change theories, after a two years long review of approaches used in preventing FGM/C throughout Africa.

A CLOSER EYE ON GENDER PLANNING

What we have been involved in the previous activities is what we would call an initial gender analysis. We have started looking to the different role that men and women have in societies and the different access and control over resources.

Because men and women have different roles, they have different needs. These are called “gender needs”.

What do we mean by gender needs? Based on the work of the French sociologist, Maxine Molyneaux, the economist of the London School of Economics, Caroline Moser, makes a point regarding the limitative use of women’s needs. First of all, the concept of women’s needs does not reflect women’s social position vis-a-vis men. Second, women’s needs vary among women depending on social class, ethnic group, etc. Therefore it is not good to think that all women have the same needs or that women are a homogeneous group.

That’s why it is more useful to talk about gender needs.

Gender needs are those needs that men and women may develop by virtue of their social position through gender attributes. Again Molineaux makes a perfect distinction of these needs.

They can be “Practical gender needs” PGN or “Strategic gender needs” SGN. PGN are the needs of men and women by virtue of their position within the gender division of labour in a given society. It is usually a response to an immediate need. For example in a rural society to have water near the household is a PGN for women, which is part of their responsibility within the gender division of labour. If we look at health, having access to family planning is a PGN for women. PGNs are aimed at actions which make the performance of existing gender roles more efficient. SGN, on the contrary are derived by the subordinate position of women with respect to men. They reflect an alternative for a more equitable division of labour. From a planning point of view, when we talk about meeting SGNs, we talk about actions which challenge the existing gender roles. For instance giving women access to land, is meeting a SGN, because it changes the relationship between men and women.

By making this distinction between PGNs and SGNs, planners become more aware of making distinction between projects that target PGNs from those that have as an objective addressing SGNs.

SGNs are challenging in nature and threatening in character.

When we use this distinction we find that most policies, programmes and projects aim to meet PGNs, as they do not intend to change the roles of men and women.

Making the distinction between PGNs and SGNs helps us to disentangle these interventions one from the other. In this way we know that if we deal with SGNs we are challenging existing gender roles.

We could then start a project with aims to meet PGNs and then develop it into tackling SGNs. For instance, if you give income opportunities to women, even if you are providing them with a traditional job that does not challenge the traditional division of labour, by giving them access to income on their own right, this might challenge the gender division of labour and empower the women.

Gender planning tools

Integrating gender into the planning cycle or into planning activities is not an easy task, because we try to integrate a non linear relationship into a linear process. If we try to integrate gender in a very simple step by step fashion we are going to fail. It is not a step by step process.

The purpose of the gender analysis is to understand the mechanisms underlying the dominant development problems and policy, programmes and planning interventions in terms of their implications for women and men and the relationships between them.

We talk about the implications of gender relations because by definition a gender analysis cannot be carried out in a vacuum.

The tools to carry out the first stage of the gender analysis are the following: we have to disaggregate participants in a particular community, we have to look at the household structure, we have to look at the different roles of men and women, who does what in a household and at community level. In this way we want to interpret the kind of gender needs that are being met or not being met.

But how do we go beyond the analysis to some kind of action?

In thinking about actions, the biggest problem that we often face is: where do we start?

The second important stage is the prioritisation of the problems that we have identified. We do not know where to start unless we understand the inter-relationships between the problems which we face. What we need to do is to construct some kind of cause and effect hierarchy of problems. We have to start looking at the negative: which are the gender needs which are not met because these are the symptoms of the problem. And then we need to ask ourselves why these gender needs were not met? We have to look at the backward and forward linkages of what lies behind these particular problems.

We have to try to identify where the problems are and how one problem is a cause of another problem.

I want to make two points here: the first is that gender analysis is an on going process. It is not something that stops with the preparation and identification of a project. It is an ongoing process because we need constantly to redefine our problems in a changing context. It may be that we need to ask different kinds of questions at different points of the cycle. The gender analysis might take a slightly different form in the way that we question but in essence what we look at each point of this process is trying to understand what is happening around roles and needs .

The second important point is that we need to ask ourselves a question: who defines gender needs?

Is it the professional, the politician, the community itself?

A complementary part of doing any gender analysis is the process of “gender consultation”, that means, especially in a community dominated by traditional structures, interrogate not only the political or community leaders, but also the women of the community , listening to the people who are committed to gender issues in the country.

We need to be aware, we need to have “gender spectacles” on when we are talking about a consultation because, if we do not, we will find ourselves only talking to certain persons and not talking to others.

When we prioritize our problems, we have a much better way of seeing where we start, where we can actually put our finger in order to start. Actually it is very useful to start to move into action by identifying working objectives (WO). You should not confuse them with the objectives of the programme/project. These are objectives used specifically to introduce gender into a particular programme or project. They are working objectives in the sense that they may be redefined as we go along in the process. We may find that we have to change and adjust them as we go through the programme/project.

We can tackle many more problems by identifying the correct point at which to enter into action.

This is a very critical way of understanding how to use resources efficiently because we do not have many resources so the ones that we use have to be effective: They have to touch as many problems as they can.

This is why it is important to try to understand the cause and effect hierarchy of problems and therefore try to see at what point we can introduce the issue of gender, where it is appropriate to introduce gender. It may be not appropriate at certain points; it may be easier at other points.

And this is why we need to identify an entry strategy (ES). An ES is a very simple and prioritised and tactical set of actions designed to expand the room for manoeuvre at a particular socio-economic junction or point, so that we can overcome the constraints which may block or subvert our interventions or to utilise the assets which may provide a resource or an opportunity to promote our intervention.

Why do we need an entry strategy? Why can't we just go and do what we want to do? We have always to keep in mind that, because the gender relations represent a set of power relations, they often resist change. Because they find their expression in institutions of the practice of our society, they are not easy to change: they resist change.

This is the case with FGM/C.

Therefore to bring about change is not a straightforward process. We need to prepare the ground for change. And this is exactly what entry strategies are trying to do. They are trying to create the conditions whereby we can move forward for change.

How do we think about trying to create those conditions. Well, at the heart of developing entry strategies, we have to understand the room for manoeuvre, that means identify what is possible to do and what is not possible to do. Why should we go on doing something that we know is going to fail? Maybe we need to prepare some ground now and then we will be able to succeed later. If we try to do it too soon we may fail, and that will be a disaster. In other words, in every situation there is a room for manoeuvre. What we need to do is to expand that room for manoeuvre.... Rather than dealing with a situation where the room for manoeuvre is perhaps restricting what we are doing, we are trying to find a way to keep an opening up so that we can do things.

In order to identify the room for manoeuvre, first we have to understand which are the

constraints. What are the constraints to achieving our working objectives? We need also to understand what are the assets and by assets we do not mean just resources, but we also mean opportunities for opening what we have. If we can identify the constraints and the assets that are acting on a particular WO, we may actually decide: hang on a second, it is not a good WO, it is too soon, let's try something new, something different. We may redefine our WO.

For instance we may decide that in order to do a proper programme/project preparation what we need is some kind of disaggregated statistics. This is even before we design a programme/project. It may even affect the decision of the identification of the project. Our WO will be to prepare documentation and then have an entry strategy for how to do it, who should do it, what kind of qualification they have, what kind of report we are trying to prepare. By doing that perhaps we just widen our room for manoeuvre because we have more information that we had before and we can move to the next step.

It is important that once we start talking about entry strategies, we also need to start talking about monitoring. Once we start, we have to follow up what is happening and how we actually are achieving what we want to do.

Ultimately we may be involved in some kind of impact assessment in the longer term. Keeping in mind that at various points we are going to find that we want to change our WOs, find new entry strategies, and then we have three or four WO operating at the same time, in order to keep expanding the room for manoeuvre.

We may also find that even before we implement any kind of project, what we need to do is to start a process of what is called Organisational Development (OD). It is very hard to introduce a programme or a project which has a completely new perspective into an organisation which is operating in an old perspective. For example, training may be an ES in order to develop the organisational capacity to cope with properly developing and implementing gender aware policy, programmes and projects.

Finally we might get to the point where we actually can identify a number of policies, programmes and projects which are really gender aware. But generally there are an awful lot of steps before we get to the point where we actually have gender aware policy, programmes and projects. These are on going processes. They are not complete steps. If we want to impose upon the cycle of a particular organisation, we can probably do that But you need to be aware of the problems you probably are going to face.

In other words, we might find that in the identification stage we have to do both analysis and gender consultation. We may find in the preparation stage that we have to talk about gender analysis. Maybe we also need to start developing organisationally in order to cope with appropriate preparation of policy, programmes and projects. We may need to put into action a number of ES in order to achieve this as well. The preparation stage may take a number of months to do and therefore we may need a number of ES to push it along in a particular way. So our process starts to take on all the different elements here that may be necessary at different point of the project cycle.

MODULE 5

5

BUILDING BLOCKS FOR PROGRAMMING

Module objective

- To identify interventions or activities in development programs for the abandonment of the FGM/C
- To understand the importance of the community participation in programs against FGM/C
- To identify tools for the monitor and the evaluation programs

Why this module?

Legislation can play an important role in the fight against FGM/C, but it is not the only one. The most important role and tool is program or/and project which involve beneficiaries and targets group in the whole process of intervention: from the identification to all the implementation phases.

The NGO within community participation has to establish dialogues with and among various groups and identifies their own local solutions. The importance of participation is to consider the community a whole in which different groups, composed by different persons who play different role, live. In fact is very important don't forget that there is a wide range of actors and external contingency factors which play an important role in the decision making process in ending FGM/C.

This module puts in evidence the tools that can help to identity and elaborate an useful project against the practice and the arrangement of a clear plan for assessing project impact.

Activities

Activity 1: Women's empowerment and community consensus inputs

Activity 2: Can the law be used to stop/prevent FGM/C?

Activity 3: Indicators for monitoring and evaluation

Activity 4: Mainstreaming FGM/C prevention: develop your program

Total time: 12 hours and 30 minutes

Activity 1

5

WOMEN'S EMPOWERMENT AND COMMUNITY CONSENSUS INPUTS

Time: 1 hour and 30 minutes

Why do this activity?

In the previous sections we have established the link between women's empowerment and development practice. We have also discussed the different meanings of the term empowerment and how these impacted on development thinking and practice. Increasingly, women's empowerment is perceived not only as a legitimate end result for development inputs, but also as the most effective way to achieve sustainable development. At the same time, we have understood that FGM/C lays at the hearth of the subordinate role of women, as women are perceived as not able to control themselves in particular in the area of sexuality and therefore not responding to men's requests and gender role models, thus in need of a "normalisation" that comes with the whole socialization process of girls and women, and goes as far as cutting off a part of their healthy body. Empowerment of women comes therefore with the abandonment of FGM/C, as much as the abandonment of FGM/C comes with the empowerment of women. For both to happen, the community around the target group needs to approve and consent to this major change in behaviour.

To facilitate this process, specific inputs need to be included in the development programs and projects where FGM/C prevention will be mainstreamed. This activity is aimed at identifying specific women's empowerment activities to be included in development projects, as well as the activities that can be introduced to build the consensus of the community towards women's empowerment, thus renewed gender roles and power dynamics within the society, always bearing in mind that the specific local conditions will determine which ones are more appropriate and may lead to additional ones.

Objectives

- To identify interventions that the organizations can include in either already existing development programs or in new ones to be designed.

How to do the activity

Step 1: 10 minutes

Put on Overhead 1 “The relation between FGM/C, social change and women’s empowerment” and go with participants through the four hypothesis:

Plenary

Overhead

Hypothesis 1

- Women use FGM/C as a power-gaining tool.
- They forego their sexual organs in exchange for social acceptability, material survival (marriage) and other freedoms such as mobility, choice and education.
- Therefore women protect and practice FGM/C.

Hypothesis 2

- By changing women’s consciousness, material conditions and decision-making ability, we shift their power base away from the need for FGM/C.

Hypothesis 3

- Shifting women’s power base will be ineffective (and maybe detrimental) unless community support and consensus are built around them.

Hypothesis 4

- Behavioural and social change is a cumulative non-linear process.
- To catalyse and sustain it requires supportive inputs over the longer term (laws, policies, investment in education, etc).

Remind participant of the power dynamics that have been explored during previous activities, in particular of the fact that women in the majority of societies in the world do not have access to and control over the resources that lead to power, and very often its other social actors that take decisions for them, including their husbands, the elder in their families, ultimately the elders in the community, etc. If FGM/C facilitates their affiliation to those “power structures”, they hardly can abandon the practice without the feeling of putting their daughters at risk of not accessing any form of participation to power and decision making.

Step 2: 40 minutes

Video screening

Invite participants to watch the video “**Fatoumata’s Story**”. Give a short introduction:

It is the story of a woman in an African country, who has undergone a painful FGM/C ceremony. Later on she has learned that the problems she experienced in her reproductive life are caused by her circumcision, and wants to spare the same destiny to her daughter. In front of the growing pressure the relatives put on her, she finds a way to bring this issue up within the community and finds an alternative solution.

After the video screening, refer back to the considerations about power and empowerment, and invite participants to share their opinions on

“Fatoumata’s Story” according to the different power dynamics and in particular around the dichotomy

FGM/C as a power gaining tool vs. **empowerment as a mean to overcome FGM/C**

using the following questions to guide a discussion on:

Note to facilitator

Questions for discussion

1. Who really takes the decision around FGM/C at the end?
2. Which are the steps needed to bring about a change?
3. Is individual consciousness about the harm of the practice enough for the abandonment of the practice?
4. Which forms of power were addressed in order to abandon FGM/C?
5. In which stage of behavioural change/social change were the different members of the community?
6. Which forms of empowerment need to be in place in order to abandon the practice?
7. How did Fatoumata build the consensus of the community around the abandonment of the practice?

Remind participants that the rate of adoption of an innovation depends on the **characteristics of the innovation**, as perceived by the audience:

- relative advantage (what is in it for me?)
- compatibility with existing values and practices (thus not disrupting social fabric)
- simplicity and ease of use (ex. of mobile phones)
- whether it has been previously tried/adopted by others (innovators, early adopters)
- observable results (abandoning the practice thus not lead to damages to the family', girls', women's lives).

This is very important for development planners, because it has direct consequences on how the abandonment of the practice has to be presented to communities.

Step 3: 30 minutes

Buzzing

Introduce the exercise with the following considerations:

Note to facilitator

Experience gained over the years has led to the four hypothesis presented in the previous overhead: only by changing women's consciousness, material conditions (access and control over resources) and decision making ability, we shift the power base and female social identity away from the need for FGM/C. But changing women's consciousness will prove ineffective, will lead only to frustration and may be even detrimental, eliciting violent reactions by partners/families/communities, unless there is community consensus and support for women's empowerment and the abandonment of FGM/C.

In order to involve the community, it is important to address its **priority development concerns**, as FGM/C abandonment is otherwise perceived as a treat to community cultural values and traditions, an un-requested interference with social mechanisms and family relationships, including economic exchanges such as the bride price, or at least as an un-relevant development issue, as it is considered a “women’s issue” and women are given only very little value in society, and this values is linked completely to what FGM/C is there fore, namely marriage and legal childbearing.

Divide participants in pairs of two, inviting each participant to work with his/her neighbour, and distribute a copy of Handout 2 with the “Instruction for the exercise” to each pair.

Distribute a set of paper sheets in 3 different colours:

- Colour 1: activities addressing overall development issues/priorities of the community
- Colour 2: activities addressing women’s empowerment without FGM/C
- Colour 3: activities to build community consensus around women’s empowerment without FGM/C

Invite participants to:

- a) choose a community where the intervention will take place
- b) give a short description of the community and **identify one priority development issue** (such as sanitation, healthcare, subsistence agriculture, child labour, HIV/AIDS, maternal mortality etc.)
- c) **select 3 priority target groups** to work with in that community in order to mainstream FGM/C abandonment in a development program/project that will address the priority development problem identified. Remember to choose the target groups **according to their stage in behavioural change/characteristics as adopters** (are they innovators, early adopters... or resisters?), reminding that the desaggregation of the community into target groups is the basis for gender and situational analysis, which in turn offer the basis for defining which working objectives, room for manoeuvre, entry strategy and project inputs should be considered.
- d) for each target group write at least three activities on the appropriate coloured sheet of paper, so that they can be identified as
 1. activities addressing the development problem in general, possibly involving as a priority target group the women
 2. activities aimed at women’s empowerment and at the abandonment of FGM/C
 3. activities to build the consensus of the community towards this new behaviour: no FGM/C practiced and women actively involved in decision making and other public activities, including development activities.

Step 4: 30 minutes

Reconvene the plenary and invite each couple to share with the group:

- a synthetic description of the community they will work in, including the development problem they have identified as a priority for the community

- the target groups they have selected to address this problem while leading to women's empowerment and to the abandonment of FGM/C
- the three activities for each target group they have foreseen.

It will become evident that the same type of activities are needed to address different target groups, and different needs in the community, and also that women's empowerment inputs will address overall development issues, if they are meant to fulfil women **strategic gender needs**.

As long as couples present their activities, invite considerations by the group.

Note to facilitator

Examples of activities that participants may propose include:

- Income generating activities.
- Sexual and reproductive health services.
- Sexual and reproductive health information.
- Basic health services.
- Irrigation systems.
- Food processing / preservation plants.
- Revolving funds.
- Increased entrepreneurial skills.
- Vocational training.
- Building women's groups/cooperatives.
- Access to education.
- Providing safe spaces for women.
- Counselling and advice.
- Sports (youths activities)
- Women's support groups.
- Advocacy.
- Meetings with community leaders/decision makers.

Give participants a few moments to go through the list, then start a plenary discussion reminding them of the "practical gender needs" and "strategic gender needs" concepts that they have been introduced to earlier.

Practical gender needs (PGN) are the needs of men and women by virtue of their position within the gender division of labour in a given society. It is usually a response to an immediate need. For example in a rural society to have water near the household is a PGN for women, which is part of their responsibility within the gender division of labour. If we look at health, having access to family planning is a PGN for women. PGNs are aimed at actions which make the performance of existing gender roles more efficient.

Strategic gender needs (SGN), on the contrary, are derived by the subordinate position of women with respect to men. They reflect an alternative for a more equitable division of labour.

Concluding remarks

Participants invariably see the link between the practical gender needs (needs of men and women by virtue of their position within the gender division of labour in a given society) and strategic gender needs, derived by the subordinate position of women with respect to men. They will be able to establish how responding to practical needs affect women's capacities and abilities to achieve their strategic needs and vice versa.

Activities suggested by participants to reach the community consensus might already have pointed out the importance of **community dialogue and participation**, a process that should be an intrinsic path towards the whole implementation of the program/project. To recapitulate some of the possible mechanisms to access the community and promote its participation and consensus around project's activities, distribute Handout 3 "Mechanisms to access community and promote participation".

Materials

- Flipchart
- Felt tipped pens
- Paper sheets in 3 different colours
- Overhead projector
- Overhead
- Video "Fatoumata Story"
- LCD project
- Laptop computer
- Handouts for all participants

Overhead

- Overhead 1: The relation between FGM/C, social change and women's empowerment

Handouts

- Handout 1: The relation between FGM/C, social change and women's empowerment
- Handout 2: Approaches to reach different segments
- Handout 3: Mechanisms to access community and promote participation

THE RELATION BETWEEN FGM/C, SOCIAL CHANGE AND WOMEN'S EMPOWERMENT

Hypothesis 1

- Women use FGM/C as a power-gaining tool. They forego their sexual organs in exchange for social acceptability, material survival (marriage) and other freedoms such as mobility, choice and education.
- Therefore women protect and practice FGM/C.

Hypothesis 2

- By changing women's consciousness, material conditions and decision-making ability, we shift their power base away from the need for FGM/C.

Hypothesis 3

- Shifting women's power base will be ineffective (and maybe detrimental) unless community support and consensus is built around them.

Hypothesis 4

- Behavioural and social change is a cumulative non-linear process
- To catalyse and sustain it requires supportive inputs over the longer term (laws, policies, investment in education, etc).

Source: Toubia, Nahid, "Legislation as a tool for behavioural change", in *Stop FGM*, Proceedings of the Expert consultation on "Legal tools for the prevention of female genital mutilation", Cairo 21-23 June 2003, AIDOS-NPWJ, Rome, 2003.

WHY EMPOWERMENT OF WOMEN MAY STOP FGM/C

- Women use FGM/C as a power gaining tool.
- By changing women's consciousness, material conditions and decision making ability, we shift their power base and female social identity away from the need for FGM/C
- Changing women's consciousness will prove ineffective, and may be even detrimental, unless there is community support and consensus.
- Behavioural and social change is a cumulative non-linear processes. To catalyse and sustain it requires supportive inputs at the institutional level of society (laws, policy, education etc).

Approaches to Reach Different Segments

The segment	The approach to reach the segment
<p>Innovators lead the way for others. They have already personally adopted the new behaviour.</p>	<ul style="list-style-type: none"> • Media sources. • Directly involve innovators in the design of the programme through Participatory Planning. • Recruit and train the innovators as the peer educators (promoters.)
<p>Early Adopters are open to new ideas that provide personal benefit. They are fashion setters, may have big egos and need a lot of personal support.</p>	<ul style="list-style-type: none"> • Inter-personal contact • Addressing concerns. • Step by step guidance to experiment with the idea. • Strong face to face support with a limited number of early adapters to try out the practice. • Reward the participants ego through media coverage. • Maintain strong relationship with this group through regular feedback.
<p>Early majority will only act when they get adequate proof of benefits. They are pragmatists, will accept simple, proven new ideas. They will adopt when there is minimum discontinuity with the lifestyle they are used to.</p>	<ul style="list-style-type: none"> • Media stories featuring endorsements from credible individuals, opinion makers. • Provide one to one support discussing concerns, and consequences.
<p>Late Majority do not like taking risks, or new ideas, but also do not want to be left behind, hence will follow the mainstream and the established standard. They can also be influenced by the sceptics</p>	<ul style="list-style-type: none"> • Refine your new idea to increase convenience and reduce untoward consequences. • Respond to the criticism from sceptics.
<p>Laggards/ Late Adopters will block progressive change. Take their arguments seriously, as they often identify real problems that need to be solved before the majority segment can accept the innovation</p>	<ul style="list-style-type: none"> • Actively enforce regulations • Publicise prosecutions

MECHANISMS TO ACCESS COMMUNITY / PROMOTE PARTICIPATION

Participatory assessment: Experience from projects shows that one of the best points into a community is during the assessment phase, whereby a joint assessment conducted by the community creates a sense of trust, and more opportunity for contact with its activities and staff.

Creating awareness of the issue through use of catalysts: A catalyst could be a person or group of people who are highly interested in the subject. Catalysts serve to alleviate suspicion and mistrust about the project, and through one to one contact answer open questions.

Examples of catalysts:

Change Agents

- those who have experienced the effects of the problem and want to be involved in finding an appropriate solution
- those who have found their own way to deal with the practice, ‘the positive deviants’

Mass Media

- mass rally
- a captivating radio programme
- theatre

Formal sessions at which people’s views are sought: Once confidence and mutual trust have been established, a context specific trigger is usually needed to initiate community dialogue on the topic of discussion. A core group then maintains dialogue within the community.

Identification and development of core groups: Once the topic is brought into the discussion agenda of the community, the project is ready to develop a ‘core group’. A core group is a group of individuals who will lead the effort on behalf of the community and who are interested in participating in the programme. This encourages greater participation, as well as providing a good entry point into the community.

The Core group (Power of a group)

meets regularly to discuss the issue and thereby keeps the topic on the agenda
collective action builds the women and girls’ confidence that they are not alone in resisting FGM/C

Being part of a support group reduces stress and social ostracisation for those wanting to give up circumcision.

Working in a group strengthens the capacity to address or advocate for change

Provides sense of ownership

Communication capacity is introduced and built, helping women to use their voices

Activity 2

5

CAN THE LAW BE USED TO STOP/PREVENT FGM/C?

Time: 1 hour and 30 minutes

Why do this activity?

The work of NGOs is at the heart of social change and can support the adoption and enforcement of legal measures to prevent FGM/C.

Very often, national-level debates over the role of the law in stopping FGM/C focus on a government's powers to control the behaviour of people living in its jurisdiction. It is assumed that laws addressing FGM/C will be criminal laws, and that the actors charged with enforcing those laws will be police officers. It is this sort of assumption that often creates uncertainty about whether law is an appropriate response to a practice as deeply engrained and socially accepted as FGM/C. Where FGM/C is practiced by a majority, it is feared that criminalization of FGM/C will simply drive the practice underground. Where it is primarily minority groups that practice FGM/C, there is concern that criminalizing the practice will only further marginalize a potentially vulnerable community.

While use of the criminal law need not have either of these undesirable effects, it is important to remember that criminalization is only one tool that governments have at their disposal. A legal approach to FGM/C can potentially engage a variety of actors, who can play a role in preventing the practice and changing attitudes and behaviours. Many of those actors might not have considered how they are in a position to implement legal and policy measures to stop FGM/C. In fact, NGOs and different national and local institutions can play a key role.

Objectives

- To identify ways in which participants can play a role in implementing and enforcing legal measures to stop FGM/C.
- To understand that laws can do much more than punish: they can also empower women and prevent FGM/C.

How to do the activity

Step 1: 45 minutes

Divide participants into small groups of up to 5 people. Each person in the group will have to play one of the following roles

1. Representative of the **legal community**: a judge, a lawyer, a public official responsible for law enforcement (police or other)
2. Representative of the **health care community**: a doctor, a nurse, a public health official
3. Representative of the **institutional/political community**: a public official working in an interested ministry (such as Ministry for Women, or Social Affairs, Health etc.), a member of parliament, a community leader
4. Representative of **civil society organizations**: women's empowerment advocate, NGO or CBO leader, village women's association representative
5. A **woman** or a **man** who wants to prevent FGM/C to be performed on her daughter.

Distribute Handout 1 How to use the law to prevent FGM/C. Task for the working group discussion.

Small group role play

Each small group will decide the legal framework for its interaction, based upon Questionnaire compiled out during Activity 2:

- there is / is not a constitutional provision ensuring women's equal rights or addressing FGM/C?
- there is / is not a reproductive health law condemning FGM/C?
- there is / is not a criminal law prohibiting FGM/C?
- there is / is not a criminal law prohibiting assault or abuse of minors?
- there is / is not a specific regulation prohibiting performance of FGM/C by healthcare professionals?
- are there other measures that can be used?

Each participant will

- put him/herself in the chosen role
- based upon the legal framework decided by the group, express how he/she would best use the existing measures to prevent FGM/C
- involve the other role players to design the most efficient strategy to use the existing legal framework to prevent FGM/C

Each group chooses a rapporteur to report back to the plenary.

Note to facilitator

Step 2: 45 minutes

Group is called back together. On a flip chart have columns for each category of professionals and have each group report briefly on the type of roles their members have played and would like to play in using the law to prevent FGM/C.

Invite participants to share their professional experiences with FGM/C and discuss questions they have had about the law, their legal obligations and the way they would like to use the law to prevent FGM/C.

Plenary

**Note to
facilitator**

Points that might come out in discussion

There are 2 main scenarios that can be envisaged by the working groups:

1. **there is** specific legislation addressing FGM/C
2. **there is no** legislation specific to FGM/C

1. In a country where **THERE IS** specific legislation addressing FGM/C

Category	How can its member use the law to prevent FGM/C
Legal community	Judge: apply the law, issue arrest order, and prosecute. Lawyer: represent girls who want to escape the practice. Raise awareness. Police: law enforcement, but needs to be sensitized
Health care community	Health care providers might establish a Code of conduct and a Supervision body for preventing members of the medical community from performing FGM/C. They might also raise questions about duties to report cases of FGM/C. Sensitize patients about FGM/C and existing laws. Play role model. Keep records of FGM/C related medical consequences to be used as evidence for law enforcement.
Institutional/political community	Government representative should spread information about existence and functioning of the law, train and sensitize local authorities, allocate budget for FGM/C prevention campaigns. Parliamentarians should ensure that resources are allocated to prevention campaigns. Play a role model for the abandonment of FGM/C. Sensitize their constituencies. Local/community leaders should sensitize population about existence/use of the law.
Civil society organisations	Inform/sensitize communities about existence of the law. Train people in using the law. Support victims. Educate youth. Women's rights organizations might talk about informing women of their rights under the law and strengthen women's capacities to use the law. Work with the media to inform about the law.
Women/Men who want to prevent FGM/C on their daughter	Seek help from lawyers. Seek assistance from NGOs or other organisation to support costs of legal action, as well as to sensitize their community about the law prohibiting FGM/C and thus facilitating the adoption of their decision.

2. In a country where THERE IS NO legislation specific to FGM/C

Category	How can its member use the law to prevent FGM/C
Legal community	Judge: apply the law, issue arrest order, and prosecute. Lawyer: represent girls who want to escape the practice. Raise awareness. Police: law enforcement, but needs to be sensitized.
Health care community	Also in absence of specific laws prohibiting FGM/C health care providers might establish a Code of conduct and a Supervision body for preventing members of the medical community from performing FGM/C. Sensitize patients about FGM/C and its consequences on health. Play role model. Keep records of FGM/C related medical consequences.
Institutional/political community	Government representative , in particular government officials from women's rights ministries, may lobby for a law on FGM/C. Parliamentarians should draft and approve legal measures to prevent FGM/C. Become a champion for the abandonment of FGM/C. Sensitize their constituencies. Local/community leaders can advocate for the adoption of legal measures, inform population about FGM/C and raise awareness.
Civil society organisations	Discuss among communities about possible benefits of a law. Promote other actions to prevent FGM/C. Sensitize communities. Work with the media to advocate for adoption of a law. Lobby parliamentarians. Inform about human rights and other existing laws. Problem of funding needs to be addressed.
Women/Men who want to prevent FGM/C on their daughter	Seek assistance from NGOs or other organisations already working for the prevention of FGM/C to sensitize their community about the practice, promoting change in behaviour. Seek help from health care providers.

Materials

- Flip chart.
- Felt-tip pens.
- Handout for each working group.

Handouts

- Handout 1: How to use the law to prevent FGM/C. Tasks for the working group discussion
- Handout 2: Cairo Declaration on legal Tools for Preventing FGM/C

HOW TO USE THE LAW TO PREVENT FGM/C

Tasks for working group discussion

Each participant chooses a role among the following five categories:

1. Representative of the **legal community**: a judge, a lawyer, a public official responsible for law enforcement (police or other)
2. Representative of the **health care community**: a doctor, a nurse, a public health official
3. Representative of the **institutional/political community**: a public official working in an interested ministry (such as Ministry for Women, or Social Affairs, Health etc.), a member of parliament, a community leader
4. Representative of **civil society organizations**: women's empowerment advocate, NGO or CBO leader, village women's association representative
5. A **woman or a man** who wants to prevent FGM/C to be performed on her daughter.

Each small group will decide the legal framework for its interaction, based upon Questionnaire compiled during Activity 2:

- there is / is not a constitutional provision ensuring women's equal rights or addressing FGM/C?
- there is / is not a reproductive health law condemning FGM/C?
- there is / is not a criminal law prohibiting FGM/C?
- there is / is not a criminal law prohibiting assault or abuse of minors?
- there is / is not a specific regulation prohibiting performance of FGM/C by health-care professionals?
- are there other measures that can be used?

Each participant will

- put him/herself in the chosen role
- based upon the legal framework decided by the group, express how he/she would best use the existing measures to prevent FGM/C
- involve the other role players to design the most efficient strategy to use the existing legal framework to prevent FGM/C

Each group chooses a rapporteur to report back to the plenary.

**Afro-Arab Expert Consultation on
“Legal Tools for the Prevention of Female Genital Mutilation”
Cairo, 21-23 June 2003**

**CAIRO DECLARATION ON LEGAL TOOLS TO
PREVENT FGM/C**

**WE, the participants in the Afro-Arab Expert Consultation
on “Legal Tools for the Prevention of Female Genital Mutilation”**

Call upon governments to promote, protect and ensure the human rights of women and children in accordance with the obligations undertaken by them as states parties or signatories to:

- the African Charter on the Rights and Welfare of the Child,
- the African Charter on Human and People's Rights;
- the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW);
- the Convention on the Rights of the Child;
- the Cairo Programme of Action agreed to at the International Conference on Population and Development; and
- the Beijing Declaration and Platform for Action agreed to at the Fourth World Conference on Women.

Believe that the prevention and the abandonment of FGM/C can be achieved only through a comprehensive approach promoting behaviour change, and using legislative measures as a pivotal tool;

Launch the Cairo Declaration, appealing to Heads of State, governments, parliaments and responsible authorities in concerned countries, as well as international organisations and non-governmental organisations, to endorse the following recommendations in their legislation, social and health policies, aid programmes, bilateral and multilateral cooperation initiatives.

**WE, the participants in the Afro-Arab Expert Consultation
on “Legal Tools for the Prevention of Female Genital Mutilation”**

Recommend that:

1. Governments, in consultation with civil society, should adopt specific legislation addressing FGM/C in order to affirm their commitment to stopping the practice and to ensure women's and girl's human rights. Where politically feasible, a prohibition on FGM/C should be integrated into broader legislation addressing other issues, such as:

- gender equality;
- protection from all forms of violence against women and children;
- women's reproductive health and rights; and
- children's rights.

2. The use of law should be one component of a multi-disciplinary approach to stopping the practice of FGM/C. Depending on the national context, outreach efforts by civil society and governments aimed at changing perceptions and attitudes regarding FGM/C should precede or accompany legislation on FGM/C. These activities should reach as many members of the public as possible and should include the participation of both elected officials and other government actors and members of civil society, including advocates, religious leaders, traditional leaders, medical providers, teachers, youth, social workers, and the all forms of media including electronic media. In particular, men must be targets of outreach, as well as family members, including grandmothers, mothers-in-law, etc. Means of outreach should take as many forms as available in each country, including community gatherings, media (radio, theatre) and other creative means of communication.

3. The work of NGOs is at the heart of social change. NGOs and government should work together to support an ongoing process of social change leading to the adoption of legislation against FGM/C. A long-term, multi-strategy approach shaping attitudes and perceptions about women's status and human rights should lead in the long-run to the criminalization of FGM/C. Governments and international donors should provide financial resources to empower national NGOs in their struggle to stop FGM/C. In addition, governments must ensure that national NGOs are able to pursue their activities freely.

4. The legal definition of FGM/C, which should encompass all forms of FGM/C, should be formulated by national legislatures on the basis of the World Health Organization definition and in consultation with civil society, including the medical community. However, depending on the national context, it may be desirable to provide for a period of sensitization to precede enforcement of the prohibition as it applies to parents and family members.

5. Governments should formulate time-bound objectives, strategies, plans of action, and programmes, backed by adequate national resources, whereby FGM/C laws will be enforced, taking into account that legislation condemning FGM/C has a moral force and an educational impact that could dissuade many individuals from submitting girls to the practice.

6. If existing criminal sanctions are enforced in the absence of specific legislation on FGM/C, governments should work with civil society to undertake a major information campaign to ensure that all members of society, particularly those who practice FGM/C, are aware that the existing law will be enforced.

7. In adopting a law, religious leaders, civil society organizations, including women's and community-based organizations, and health care providers, among others, should be part of the consultative process. Efforts to end FGM/C must be focused on empowering women to make choices impacting their health and lives.

8. Religious leaders should be sensitized to the negative impact of FGM/C on women's reproductive and sexual health. Religious leaders who support ending FGM/C should be incorporated into outreach strategies.
9. Once legislation prohibiting FGM/C has been adopted, whoever performs FGM/C, including health professionals and traditional circumcisers, should be put on immediate notice that performing FGM/C gives rise to legal and professional sanctions.
10. Licensed medical practitioners should be subject to the maximum available criminal penalties. Professional associations should adopt clear standards condemning the practice of FGM/C and apply strict sanctions to practitioners who violate those standards. Practitioners may be suspended or lose their licenses to practice. In addition, they should face civil liability for malpractice or unauthorized practice of medicine. Appropriate ethical guidelines against FGM/C should be incorporated into medical education and training curricula.
11. Provided sufficient outreach and sensitization has taken place, members of the community with knowledge of cases of FGM/C should be held criminally liable for failure to report such cases. Special measures are needed to protect those who come forward to report a case. Governments should consider alternative methods of monitoring prevalence and effects of FGM/C, for example, through gathering statistics from health care centers. Law enforcement officials should be trained to respond to cases of FGM/C (including cases that may still be prevented) in a manner that meets the needs of girls and women affected by the practice.
12. Women and girls should be empowered to access legal remedies specified by law to prevent FGM/C. In particular, women and girls who are victims or potential victims of FGM/C have the right to bring a civil action to seek compensation from practitioners or to protect themselves from undergoing FGM/C. Resources, such as information on legal rights, legal assistance, and social services and support for girls who may face negative repercussions from their families and communities, should be provided to women and girls. Medical professionals should assist by providing evidence supporting the claim of the girl or woman who has undergone FGM/C. The deterrent effect on practitioners of possible civil actions against them involving monetary damages may be significant.
13. The age of a girl or woman or her consent to undergoing FGM/C should not, under any conditions, affect the criminality of the act.
14. During periods of armed conflict, both governments and international donors must sustain activities aimed at ending the practice of FGM/C and other forms of discrimination against women and girls.
15. As agreed at the International Conference on Population and Development in Cairo in 1994 and the Fourth World Conference on Women in Beijing in 1995, as well as their subsequent reviews, governments should ensure all women access to the full range of reproductive and sexual health services and information. In addition, reproductive and sexual health information and education, including informa-

tion on the harmful effects of FGM/C, should be incorporated, where appropriate, into school curricula and other community education programs. Women who have undergone FGM/C should have access to the information and special health care they need.

16. In countries where minorities, including migrants, are vulnerable, the adoption of laws against FGM/C should not be used by governments to undermine the full enjoyment of human rights by these minorities. In such contexts, it is particularly important that criminal legislation be part of a broader strategy to provide resources to support community needs and to promote the health and human rights of community members. Members of minority communities, particularly activists working to stop the practice, should be consulted and their views taken into account prior to adoption and enforcement of the law. In some cases, it may be appropriate for legislation targeting FGM/C to make reference to constitutional protections of minority rights.

17. Governments should implement the regional and international conventions that they have ratified protecting the rights of women and children, and comply with their obligations to take action to end practices that harm women and girls, including by adopting legislation prohibiting FGM/C. Implementation measures should include translation of these texts into national languages and outreach programs to ensure broad knowledge of the rights protected. Civil society could promote government accountability under these treaties by using UN treaty monitoring bodies. NGOs can use treaty bodies' Concluding Observations and Recommendations to push for additional government actions. For example, legal mechanisms to intervene on behalf of children who may be subject to FGM/C may currently be inadequate but could be developed.

**WE, the participants in the Afro-Arab Expert Consultation
on “Legal Tools for the Prevention of Female Genital Mutilation”**

Further recommend that:

The Cairo Declaration will be officially presented to the Secretary-General of the United Nations and the presidents of the African Union and the European Union, as well as the Secretary-General of the League of Arab States and the Organisation of Islamic Countries;

Finally,

We agree to hold a follow-up meeting to be convened on the African continent in a year's time, to review progress achieved towards the implementation of the Cairo Declaration.

Cairo, 23rd June 2003

Activity 3

INDICATORS FOR MONITORING AND EVALUATION

Time: 1 hour and 30 minutes

Why do this activity?

Methodology for assessing impact of projects directed at social change is in its infancy. That is also true of projects to stop or abandon FGM/C as little investment has been made in this area in the past. Developing a clear plan for assessing project impact is an essential component of the project itself, as it will contribute to the improvement of the action. In the past most widely used methodology for impact assessment was that of measuring the knowledge, attitude and practice (KAP) or behaviour (KAB), with the underlying assumption that by providing factual information, usually through information, education and communication (IEC) campaigns, there is a change in the knowledge base that will lead to a change in attitude, that will then translate in a change in practice or behaviour.

KAP/KAB impact assessment relies too heavily on the assumption of exclusively rational basis for human behaviour, not taking into account the more complex psychological and social dynamics that underlay such behaviour. It also assumes that change in knowledge is an automatic guarantee for a change in attitude sufficient to take the risk of changing practice or behaviour. It does not allow for the fact that change, in particular towards a behaviour or practice that is not yet perceived as a needed and beneficial modification, is not always progressive nor linear, and that other social, economic, cultural or psychological factors must be taken into consideration to facilitate a positive and irreversible change in behaviour.

Finally the KAP/KAB methodology only measures individual behaviour and group or social behaviour is inferred through simple statistical aggregates: it ignores the consensus building, “snow balling” and contagious elements of social change.

In the FGM/C field, evidence is gathering that many communities have acquired the knowledge of the harmful effects of the practice, but have failed to change attitudes and/or behaviours. Lessons learned from HIV research confirm this, in particular when it comes to adopting safe sexual behaviours. “Sexual interaction”, as W. Parker points out, “takes place in a wide range of contexts and along a continuum of consent that extends from willed or conscious engagement in sexual activity to unwilled non-consensual sex, that include the use of coercion and possibly physical violence”. Similarly, the decision making process around FGM/C involves a wide range of actors and is influenced by a number of external contingency factors.

At the same time large surveys, such as the DHS, Demographic and Health Surveys, administered by Macro International and funded by USAID, and the MICS, Multiple Indicator Cluster Surveys, carried out by UNICEF, both using large samples of the population, have included a questionnaire on

FGM/C, with the aim of measuring, among other aspects, prevalence of FGM/C (the number of women aged 15-49 years who have been submitted to the practice, and the trend towards its possible abandonment (number of women aged 15 to 49 years that have at least one daughter circumcised). Today a comparable set of data is available for a large number of African practicing countries. For some of these, where DHS or MICS have been conducted twice with an average distance between the two surveys of about 5/6 years, it is also possible to understand changes happening over time. In almost all of these countries the opposition to the practice is increasing, in particular among the younger generations. For example, data show that higher educational attainment among women is closely associated in almost all countries with a significant increase in disapproval of the practice. This is particularly relevant for programs and projects aimed at the abandonment of the practice, as it casts a light on their possible efficacy or failure.

Objectives

- To understand how to monitor and evaluate activities promoting the abandonment of FGM/ mainstreamed into development programs and projects.
- To identify a set of indicators to measure progress towards the abandonment of the practice.

How to do the activity:

Step 1: 30 minutes

Divide participants into small groups. Distribute Handout 1 with the description of the project “Integrated initiatives for the empowerment of women as a strategy for the abandonment of FGM/C: a community approach in Keiyo district, Kenya”.

Ask each group to read the project carefully and then to define a set of indicators to monitor and evaluate the impact of the project, having in mind that they should measure:

1. changes in the community, based on the initial gender/situational analysis
2. stages of behavioural/social change of community members (identify the stage of behaviour the different target groups are in, after project intervention)
3. empowerment of women
4. changes in decision making power
5. consensus of the community towards abandonment of FGM/C
6. influence of external factors
7. benefits on development activities gathered through the abandonment of FGM/C

Remind participants that the Stages of Change Model, with its five stages:

- pre-contemplation
- contemplation
- preparation
- action
- maintenance.

Small group discussion

Handout

Note to facilitator

Note that this model illustrates how between the decision to act to stop circumcision and the sustained irreversible behaviour (i.e. circumcision averted) there is a stage of 'maintenance' whereby opposition to the new behaviour and the chance of the decision being over-ruled by others is managed. In other words the 'declaration' by an individual or a family not to circumcise is only the first step in a process that will hopefully lead to irreversible new behaviour. When a family commits to taking the action further strategic efforts must be put in place to support the maintenance of their decision. The component of building community consensus is therefore as vital as focussing on changing the consciousness of the primary stakeholders, the women.

Step 2: 30 minutes

Plenary

Ask one person to come to the flipchart. Ask each group to share the indicators they have developed for each area, and why they have chosen a particular indicator. Have these listed as soon as contributions from all groups offer additional indicators and reasoning.

Then wrap up the discussion based on the following considerations:

Note to facilitator

Possible indicators for the proposed project might include:
girls' school enrolment rates

- number of girls completing education
- number of girls not circumcised in the target area
- increase in age at marriage of girls
- girls participating in alternative coming of age ceremony
- number of people participating in the community support group
- number and content of meetings and actions by community support group
- number of families upholding the decision to not circumcise their girls
- number of activities funded by the revolving fund
- number of young men stating to be ready to marry uncircumcised girls/women
- number of mother changing attitude/opinion towards non circumcised daughters in law
- number of other girls/women who ask to be part of the program
- continuity over time of project activities without further economic support by the NGO

...

The most crucial question in developing evaluation and monitoring indicators is how to define success. The only acceptable success or "outcome indicator" is the irrefutable proof of **irreversible abandonment of the practice in a family or a community, which can only be measured over time.**

Sustained change in behaviour is only seen as a lengthy process involving many individuals and numerous social dynamics following a variety of inputs at individual and community level. Such a process does not have a simple and clear-cut beginning or end, as the age of circumcision may shift, or an intervention may later be reversed.

Consider that decision to abandon FGM/C is not taken by one individual, as in the case with cigarette smoking: it is a decision taken on behalf of a minor that may involve several individuals including father, mother, grandmother, aunts, and potential in-laws.

Successful behavioural change will not result in averting circumcision of girls unless the individual taking this decision wields disproportionate amounts of power or others in the decision making circle are also converted.

The **publicly declared intent** to abandon the practice is one of such indicators. This can take different shapes: from a public declaration of a whole community coming together, some times with a group of intra-marrying villages, as in Tostan programs implemented in Senegal and more recently in other countries such as Guinea, the Gambia, Burkina Faso, Sudan and Somalia; through an alternative rite of passage; through a public statement and active engagement in a prevention program as a “positive deviant, a.s.o.

In terms of the reliability of a public declaration as a diagnostic indicator of whether a circumcision will remain averted, it could be safely assumed that if a whole family or community announces the decision not to circumcise a daughter there is a higher chance that the decision will be sustained. Such arguments can be applied more strongly to larger social units. If a community is cohesive and makes a joint declaration to stop circumcision there would be wide support for lasting change.

It therefore seems that the validity of public declarations as an indicator of true abandonment of FGM/c and its reliability for projecting sustainable change increases with the size of the unit making the declaration (individual, family, a social group or a whole community). Obviously this will only apply where social units are cohesive enough to reach joint decisions and will only be convincing if there is evidence of genuine debate and discussion around the issue before the declaration is made. It is also likely to be more valid in settings where the social value of ‘word of honour’ is still upheld.

Step 3: 30 minutes

In order to gather the information needed to monitor and evaluate project impact several methods are proposed. The facilitator introduces them to participants, soliciting their appreciation and critical views on the topic.

Lecture and discussion in plenary

Note to facilitator

Community based monitoring and evaluation methodologies

As mentioned earlier the component of building community consensus and support forms a vital element within the WECC framework. Involving the community in monitoring allows for further sustainability of the project, creating a sense of ownership amongst community members. There are different approaches in how to involve the community in a participatory manner. Using participatory approaches and participatory monitoring & evaluation differs from the more conventional approaches to monitoring and evaluation in that it aims to engage key stakeholders more actively in reflecting and assessing the progress of their project and in particular the achievement of results. Over the past years, participatory approaches have gained an increased popularity in the field of development and are being adopted more in developmental programs.

Some Key Principals of Participatory Monitoring and Evaluation, adapted from CIDA Result-based Participatory Monitoring and Evaluation, 2001, include:

- **‘Participation’** - which means opening up the design of the process to include those most directly affected, and agreeing to analyse data together;
- The inclusiveness of PM&E requires **‘negotiation’** to reach

agreement about what will be monitored or evaluated, how and when data will be collected and analysed, what the data actually means, and how findings will be shared, and action taken;

- **'learning'** which becomes the basis for subsequent improvement, change and action
- • Since the number, role, and skills of stakeholders, the external environment, and other factors change over time, **'flexibility'** is essential.
- The importance of "handing over the stick" and creating the space for **respect and participation**
- Living with the community and **integrating** oneself with the local customs

There are a wide range of methods and tools that have been developed to carry out participatory monitoring and evaluation. They all seek to compare the situation before and after a particular intervention, of set of events. The following are a few examples:

Visualised analysis - Visualisation techniques provide opportunities for creative reflection because they enable people to represent their own ideas in a way which they can discuss modify and extend. Examples of some of these methods include; participatory mapping; photograph analysis; flow diagrams; Venn diagrams; daily and activity profiles; pie diagrams.

• **Interviewing and sampling methods** - Examples of such techniques include; semi-structured interviewing; direct observation; focus group discussions; key informants; social maps.

• **Group and team dynamics method** - Examples of such techniques include; team review sessions; interview guides; villager and shared presentations; process notes and diaries.

Community Based Monitoring for FGM/C

Using community based monitoring techniques for FGM/C is still at a rudimentary stage. Different Settings for Conducting the Monitoring could be at existing points of services such as:

- Health services (e.g. women attending antenatal clinics, family planning clinics or child immunization)
- Education services (e.g. at primary or elementary schools through the teachers or nurses within the schools).

For all of the above, staff training may be required to notice changes amongst girls at risk, being able to identify and differentiate between the different types, etc and also understanding the social and cultural setting within which they are working. There are ethical and regulatory considerations that need to be clarified in monitoring with special attention to informed consent.

Examples of Different techniques for Community Based Monitoring of FGM/C

Voluntary Self reporting - Voluntary self reporting, such as parents reporting on the status of their daughters before & after the project intervention. Unfortunately self-reporting brings in issues of validity, reliability and in some cases deception, such as occurred in the longitudinal study of the reproductive health project in Navrongo, Ghana. In Egypt following the Egyptian Demographic and Health Survey in 1995, a comparison of self reporting with clinical findings was performed by the Egyptian Fertility Care Society in 1996, to allow for assessment of self reporting for a sample of 1339 women in eleven clinics, with clinical examinations undertaken by gynaecologists. The findings unveiled a 6% discrepancy between the selfreporting (97%) and the actual clinical findings (93%), which is within the statistically

acceptable variable. In this case self-reporting was closely compatible with clinical findings.

Observation of Cut status - Observation of cut-status after the project

intervention provides an ultimate indicator of whether the girl is cut or not, but it is very hard to measure with there being ethical and rights considerations. Observation of cut status can be done through routine pelvic examination of gynaecological patients and during antenatal care and delivery. This method of data gathering is non-invasive but compromises on lack of full representation of the sample.

Community Based Monitoring through “CARE” Methodology

As seen above there are different issues which arise in how community based monitoring is conducted. Based on this, we recommend using a **Creative, Appropriate Reliable and Ethical (CARE)** method, which might assist in providing guidelines on which techniques and tools could be used in a particular setting. As the Publicly Declared Intent (PDI) is currently the first recommended indicator for assessing impact, it can be integrated within the monitoring systems developed. As an example through developing of a monitoring system which will track record the status of families whom have declared that they will not circumcise their girls, through an interview, a public declaration or announcement and follow up through routine visits. Such a follow up undertaken by the community is currently being undertaken by the **Positive Deviants** approach, which uses a surveillance monitoring through records and family visits of at risk girls:

*?Families of girls at risk tracking: after 6 months, the focus shifts to the girls at risk families. The local NGOs, with the Positive Devian (PD), define the meaning of ‘at risk.’ They decide the at risk age, working on the specific community, and they also do mapping, trace and write-down all the families that have girls, then during the workshop they discuss with each other (local NGO’s & PDs) and define & decide what the at-risk age in the given community. Every positive deviant chooses families, which they will be responsible for, for close monitoring. At this stage focus is on the family, there is a kind of **tailoring**, the intervention itself is not pre-made. Local team, the PD’s, will keep on monitoring and tracking...an on-going interaction that supposedly will go on very closely. After speaking with each one of the family members, they decide how they can intervene, in order to reach that step of stopping FGM. The shape of how it is done is for the PD’s to decide. Becoming a community ownership...not a project at this stage...PD’s supposedly continue monitoring & tracking, which goes on until the girl is not longer at risk.”*

Positive Deviants Methodology described by Sahar Mashhour, Grants Program Manager, CEDPA

Drop in Incidence and Prevalence

Drop in incidence rates can be measured through community monitoring. Drop in prevalence rates can be measured through repeat national surveys such as the DHS or through independent local pre and post intervention surveys or through case control studies.

To conclude

Distribute to participants handouts concerning the evaluation of the Tostan project carried out by Population Council, and invite participant to consider the positives impact of the program on a variety of conditions, including better sexual and reproductive health, school enrolment of girls etc.

Handout

Materials

- Flipchart
- Felt tipped pens
- Handouts for the small groups

Handouts

- Handout 1: Integrated initiatives for the empowerment of women as a strategy for the abandonment of FGM/C: a community approach in Keiyo district, Kenya
- Handout 2: xxxxxxxxx
- Handout 3: Convention shift in Senegal
- Handout 4: The Community Based Education Programme
- Handout 5: Final consideration on the TOSTAN programme
- Handout 6: Evaluation of the Tostan program in Senegal by Population Council
- Handout 7: Community based monitoring and evaluation methodologies

PROJECT

Integrated initiatives for the empowerment of women as a strategy for the abandonment of FGM/C: a community approach in Keiyo district, Kenya

1. Problem statement

Girls in Chemoibon location face school retention and completion problems due to FGM/C, teenage pregnancy, early marriage and poverty. As a result the community during the Situation Analysis identified education as a need to be addressed in order to have girls remain and complete their education which is crucial to empowerment of women. They felt that young men would soon lack women to marry from the community because girls are not educated to the level of the men.

Women's participation in economic activities is restricted to tilling the land for subsistence production of crops and limited access to income generated from the produce. This leaves women with insufficient income to sustain their daughter's education.

Proponents of FGM/C have sited culture and tradition as reasons for the persistence of the practice which help reinforce the subordinate status of women in family and society. Women have been used by men and society to perpetuate FGM/C denying girls education which is key to women's empowerment.

2. Justification

Education is key to advancement of girls in career development which translates into the empowerment of women in the long run. Girls who complete the education cycle make informed choices regarding issues that affect their lives i.e. FGM/C, choice of marriage partner and time of marriage. Educated women do not depend on men for decisions and income since the level of education earns them sufficient money and the confidence gained through access to information. As a result they make informed decisions on the abandonment of FGM/C.

Culture and social values used to justify the continuation of the practice can be addressed through the initiation of girls without circumcision which promote positive values of the community. The strategy integrates these values with the value of education, empowerment and abandonment of FGM/C. These components are complementary to the needs of the community in the promotion of retention and completion of girls' education. This will change the value of dowry paid in exchange for girls at marriage and the added value of women's worth. This shift in value of education is an appropriate entry point for the project to introduce dialogue and built consensus with the community on the abandonment of FGM/C.

Acquisition of business skills prepares women and girl drop-outs to start and manage small business enterprises for self-reliance and empowerment. Financial support given to women who have acquired skills on establishment and management of the enterprises will enable them to start income generating activities. Income generated will contribute support girls' education, which will lead to a decrease in demand of FGM/C by girls as education make them remain in school longer and make informed choices thereafter.

On the other hand, women's increased income will lead to self-reliance and empowerment resulting in their decision to abandon FGM/C.

2.1. The target area

The project area has been restricted to one location, namely Chemoibon. The estimated population is 5,750. The sex ratio of female to male in the district is 100:98. The number of female population is 2,904 whereas that of male is 2,846, with a population density of 58 persons per km². (CBS, 2001).

The major economic activities in Chemoibon are livestock: native cow breeds, sheep, chicken, goats and donkeys for transport, bee keeping, and cultivation of fruits, millet, green grams and groundnuts. These activities do not adequately sustain the livelihoods of the population due to the harsh climatic conditions resulting in high poverty levels manifested by low living standards, famine and hunger.

2.2. Incidence of FGM/C in the target area

The results of the situation analysis revealed that it was difficult to determine the prevalence of the FGM/C practice since it is carried out in secret on girls and on women through coercion, which make reporting difficult. Women are also subjected to the cut during delivery when they are helpless and not consulted. The community does not consider female circumcision a problem.

The age range for circumcision is 15 to 18 for girls, 20 years and above for school drop-outs, and for married women aged 30 and above. There are exceptional cases where women of over 40 years are circumcised to remove the taboo on the occasion of the circumcision and marriage rites of the male child.

3. Project's goal and objectives

3.1. Goal of the project

The goal of the project is abandonment of FGM/C.

3.2. Specific objectives of the project

1. To promote retention and completion of education circle of girls for advancement and career development through education forums, use of role models and adoption of initiation without circumcision.
2. To train women and girl drop-outs to acquire skills on small business enterprise for their empowerment.
3. To provide a revolving fund to trained to women and school drop-out girls for establishment of income generating activities.
4. To establish support groups of specific population groups to support the efforts of the project on the abandonment of FGM/C.

4. Target population groups

The primary targets are: Women (mothers in-law), girls and selected men who support anti-FGM/C programs. Secondary targets are circumcisers, initiators and TBAs who have been carrying out the practice.

4.1. Reasons for target groups

The above groups are targeted by the project because of the role the play in perpetuating FGM/C. Each population group will be involved through activities

geared towards abandonment of FGM/C. The women initiate the need for and take a decision concerning the practice, the girls demand circumcision due to pressure from the mother in-law and the side targets carry out the practice following instructions from mother in-law of the girl. The men are allies, supporters and catalysts of change whose involvement in the project will increase community consensus for the abandonment of FGM/C. Women and secondary targets will participate in the project as facilitators during the initiation of girls and as decision makers to abandoning the practice. Girls are the beneficiaries of the project and will make decisions to abandon FGM/C.

5. Proposed activities

5.1. Initiation of 50 girls from each of the three sub-locations of Chemoibon location using *Tumdo Ne Leel* curriculum, whose contents has education and career development, empowerment and effects of FGM/C among others.

The initiated girls form a critical mass of peer educators who influence through interaction and behaviour change of other girls and young men to positively appreciate initiation without circumcision. They will be encouraged to establish clubs which will disseminate information on girl/women rights and effects of FGM/C on girl's reproductive health, education and empowerment, through debates and public forums (parents' day, public holiday, prize giving days among others). Through these, girls will be able to discuss openly issues of sexuality which are considered taboo by the society and be able to make informed decisions.

TNLSG will provide 6 days training course to the girls from 7 primary and 3 secondary schools on how to establish youth clubs and identify club leaders who will lead members in anti-FGM/C efforts.

Established clubs will be involved in the writing of articles on issues of sexuality, career choice and education advancement through the support of TNLSG. The newsletter published quarterly by a TNLSG will be a media of communication on anti-FGM/C messages and on the experiences of girls who have been initiated and reports for incidences of sexually related cases from the community by girls and women. It will also be used to inform boys of women sexuality and their reproductive health and disease prevention. This will help both boys and girls understand their sexuality and make informed decisions on issues of sexuality hence reducing early pregnancy which cause school drop out of girls and sexually transmitted diseases which arise as a result of unprotected sex.

The Support Group (created under activity 5.5.) will be meeting with the 3 leaders from the ten schools end of each term to review activities and impact of the club as well as plan for the following term's activities. Such meetings will ensure sustainability of clubs after the girls move to the next level of their education level e.g, upon finishing class eight and fourth form because the club leaders will have been empowered with leadership and management skills that will see them give others opportunities.

5.2. Train initiators (*motirenik*) on TNL curriculum to prepare them on the initiation of girls. Education sessions will be integrated in the training sessions so as to increase retention and completion of education by girls.

Initiation of girls without circumcision gives the traditional circumcisers and initiators a new role in moulding the future of the girls hence abandoning FGM/C. During the training, *motirenik* will understand effects of FGM/C on the lives of others and their own, and will embrace the new coming of age concept for their girls hence strengthen efforts towards abandonment of the practice.

5.3. Training of 9 women and 6 girls drop-outs on skills for initiating income generating activities in three sub-locations of Chemoibon location for two days.

Training curriculum will be borrowed from an organization who has been conducting training on micro-enterprise. The said organization through an agreement with TNLSG will also provide facilitators for two-day training at a central venue in Chemoibon location. Training contents will be: Skills for starting small business enterprises, identification of small business enterprises, management of enterprise (basic book keeping skills), production/sourcing of raw materials, credit acquisition and management, and marketing of products among other skills which include leadership and group dynamics. A criterion for selection is as shown in Annex I. The trainees, besides carrying out their business enterprises, they will be campaigners for abandonment of FGM/C and will serve as facilitators during initiation of girls.

5.4. Establish a revolving fund to benefit the trained women and school girl drop-outs to enable them establish and manage small business enterprises for income generation.

The executive committee is responsible for the management of the fund through the Programme Co-ordinator who will be answerable to the committee. They are also responsible for development of funding criteria for implementation by the Programme Co-ordinator. Women and girls who will have been identified for training will form a group of five made of three women and two girls and guarantee each other. In cases default, the remaining members will be held responsible. Amounts loaned will be increased progressively depending on the performance of the business, until the project term is ended.

5.5. Identify support groups comprising of TBAs, traditional initiators and circumcisers - women and few men, decorators (men) and young men (who are future husbands and consumers of uncircumcised girls) to support efforts for the abandonment of FGM/C.

The two support groups will be identified and trained on WECC Programme after which they can meet regularly to discuss strategies and plans to strengthen their capacity and advocate for change in the community. They will enhance the efforts of the project on the abandonment of FGM/C.

The men support will influence young men to marry uncircumcised women, the married men to retain their uncircumcised wives, and complement the work of women's support group. The women support group will participate in the initiation of girls without circumcision and will not participate in the circumcision of girls and young women. These are people who have taken a stand against FGM/C and will act as allies and monitors of FGM/C incidences in the community and promoters for

FGM/C abandonment. They will complement the efforts of TNLSG hence will not cause conflict.

Support groups, beside participating in the initiation without circumcision, improve communication and leadership skills and enable women and youth to use their voices hence promoting anti-FGM/C efforts e.g. support the youth in promoting anti-FGM/C in public forums and liaising with school management on behalf TNLSG with regard to establishment of anti-FGM/C clubs. Through these they will build confidence of women, girls and youth in general.

6. Expected project outcomes

- a) Empowerment of women and retention and completion of education circle by girls. Empowered women and educated girls will be able to make informed decisions in life and specifically with regard to FGM/C. The women are able to make decisions and manage their initiatives in the community. Educated girls will prioritize their goals in life, including advancement in education and career development as opposed to early marriage.
- b) Increased community consensus for abandonment of FGM/C. The community at large will appreciate the value of education and anti-FGM/C project; hence provide support for abandonment of FGM/C. Parents will be committed towards retention and completion of education by their daughters (girls) resulting in empowerment of women. Men support group will have influenced the change of attitude towards uncircumcised women by young men who will marry them.

7. Risks for implementing the project

The risks anticipated in the implementation of the project are community needs which keep shifting according to situations and prevailing conditions; and change in the current assumptions that FGM/C affects only girls but in essence married women are also at risk.

The risks can be addressed through building consensus with the community through the management team of the polytechnic so that information can be channelled through them when need arises. Our programs will be undertaken when students are out of session by complying with the regulations of the institution. The project will play complementary roles in the mobilization of the youth to pursue technical courses offered at the polytechnic. The shift in the practice will be addressed by the empowerment of women who are decision makers on the practice. The shift in community needs will be addressed through the completion of the education circle of girls who will decide against FGM/C practice. The project team together with support group identified will act as early detectors of change in community needs. When the project consults the allies on such issues they will be able to integrate community needs and concerns, hence maintaining the momentum for the abandonment of the practice despite the risks.

CONVENTION SHIFT IN SENEGAL*

In September of 1996 women involved in a basic education program in Malicounda Bambara in Senegal decided to seek abolition of FGC in their village of about 3000 people. Using the communicative and organizational skills learned in their education program, the women proceeded to persuade the other women in the community, their husbands, and the traditional and religious leaders of the village that such a decision was needed to protect the health of their girl children and to respect human rights. On July 31, 1997 the village of Malicounda announced to the world its decision to abandon FGC and urged other villages to follow their example. Although some members of the Bambara ethnic group had stopped on an individual basis, no village had ever made a public and collective commitment to stop the practice. The commitment worked: public opinion continues to resolutely oppose FGC and deviators would be identified and shamed. This is the first unequivocal collective and contagious abandonment of FGC on record, and the event supports the convention hypothesis of FGC.

Their decision was controversial among those who had not worked through the Malicoundan's reasoning on the issue, and some neighboring Bambara, Mandinka, and Sosse people, both men and women, were angry and sent hostile messages to Malicounda. The women were hurt and depressed, yet defended their position, and even traveled to the villages of Nguerigne Bambara and Ker Simbara to discuss their commitment with women there in the basic education program. On November 6, 1997, the women of Nguerigne Bambara decided to renounce FGC forever. On November 20, 1997, the President of Senegal made a public declaration against FGC and called on the nation to emulate the women of Malicounda. At the same time, the people of Ker Simbara decided that they could not stop FGC without consulting with their extended family that lived in ten villages near Joal. This point also supports the convention hypothesis: the Ker Simbarans were aware that a change would have to involve the entire population among whom they commonly intermarried. Two men, one a facilitator in the basic education program, the other a 66-year old imam who had been a student of the basic education program, went from village to village to discuss FGC. The men were at first afraid of being chased out of the villages for talking about such a sensitive and controversial topic, but the fact of the Malicounda decision provided an opening for discussion. I infer that the demonstration effect was important: that the Malicoundans had succeeded at a collective abandonment and had avoided bad consequences.

Three representatives, including the village chief and two women, from each of the ten villages, gathered in Diabougou on February 14 and 15, 1998, along with delegations from Malicounda Bambara, Nguerigne Bambara, and Ker Simbara. These 50 representatives of 8000 people in 13 villages issued the Diabougou Declaration.

We declare:

Our firm commitment to end the practice of female circumcision in our community.

Our firm commitment to spread our knowledge and the spirit of our decision to our respective villages and to other communities still practicing female circumcision. . . .

We make a solemn appeal to the national and international community to quickly mobilize their efforts to assure that girl children and women will no longer suffer the negative health effects associated with female circumcision.

The ten villages had not gone through the basic education program, rather they had been persuaded by the emissaries from Ker Simbara, but the ten villages petitioned in the declaration to have the basic education program brought to them as well.

THE COMMUNITY BASED EDUCATION PROGRAMME*

TOSTAN's activities in the Kolda Region started in 1988, when UNICEF financed an experimental program of informal education for the development of the Pulaar language in 20 villages in the Departments of Kolda and Vélingara. The results of this experimental program were so popular with the local people and the regional authorities that TOSTAN was requested to extend the program to more communities. TOSTAN thus returned in 1996 to cooperate with a newly formed local NGO, KORASE, in launching an education program in the context of the pilot phase of PAPP, financed by the World Bank in 14 communities around Médina Chérif in Kolda. This education program led to the first public declaration in the Kolda Region on June 2, 1998 of the abandonment of FGC and of early marriage. TOSTAN then sought and obtained support for extending the program further, again in cooperation with KORASE, to 23 more villages in the same area. UNICEF financed TOSTAN and at the same time, KORASE received funds from CEDPA to introduce the first part of the education program covering human rights, problem solving, health and environmental hygiene in 30 villages, in cooperation with another NGO, OFAD-NAFOORE. These two interventions led to two more public declarations, on November 27, 1999 at Bagadadji including 105 communities, and on March 25, 2001 at Mampatim including 108 villages.

To sustain and build on this movement for abandoning FGC in an area where it was practiced by almost 90 percent of women, TOSTAN sought and received funding from GTZ for a project carried out as follows:

- 90 communities were identified by TOSTAN, OFAD-NAFOORE and by local staff from the Ministries of Health and of the Family;
- A social mapping study of these 90 communities was undertaken by TOSTAN's local staff;
- Senior staff (coordinator, supervisors and facilitators) from OFAD were trained in all aspects of TOSTAN's basic education program, including teaching, administration, strategies for introduction, follow-up and evaluation;
- Community Management Committees were trained by the nine supervisors;
- One facilitator per community trained 30 participants in each community in the Pulaar and Mandingo languages. Classes, each of two hours, were held three times a week. From January to June 2001, classes covered human rights, problem solving and hygiene. During the rainy season, participants were given books to help them revise and remember what they had learned in their classes, and they also carried out social mobilization activities. A total of 2,339 women and 221 men participated in the program.
- Follow-up of the classes in all 90 villages was undertaken by the coordinator, the supervisors, by members of OFAD-NAFOORE's staff and by TOSTAN's instructors;
- Inter-village meetings were held by the community management committees to exchange experiences and to take decisions concerning collective actions;
- Information and social mobilization activities were held in the 90 villages and in

other neighbouring communities by local staff of the Ministries of Health and of the Family;

- A public declaration was organized at Karcia on June 5, 2002, to declare the abandonment of FGC by 300 villages.

These activities were implemented through the following strategies:

- Involvement in project activities of local staff from the Ministries of Health and of the Family;
- Informing the traditional and religious leaders and the elected politicians of the area about project activities;
- Cooperation with, and building capacity of, a local NGO to carry out the project developed by TOSTAN;
- Choosing 10 neighboring villages in each targeted area to pursue social transformation of the area;
- Selection of facilitators and supervisors from the communities that participate in the program;
- Setting up and training community management committees to manage project activities and to ensure that progress can be sustained;
- Holding inter-village meetings in support of the project aims and to confirm collective decisions;
- Holding a Public Declaration.

Since 1997, TOSTAN has organized a public declaration by a large group of villages that have agreed to abandon FGM/C as a strategy to enable the people themselves to renounce a traditional practice without fear of social stigma. The declaration is not intended as an end in itself, but constitutes an important step in the process of finally abandoning FGC. The declaration is seen as a way of promoting human dignity, human rights and the health of girls and women. It is intended as a positive step, which should be a joyful occasion that reinforces the positive aspects of traditions as it marks an important moment in the life of the communities.

TOSTAN is aware that in launching any significant social movement that is intended to bring about profound changes, a small group of informed and enlightened people will be the first to commit themselves in the name of the community as a whole. Others will remain hesitant and sceptical. It is likely, also, that a small proportion within the community will remain opponents to this change, but it is anticipated that eventually the new behaviour (i.e. not practicing FGM/C) will become the norm, rather than being practiced by a minority. TOSTAN has come to acknowledge the essential contribution to the process of social change made by this declaration, and so it is essential that the communities themselves consciously and actively pursue the process from within.

* Diop, Nafissatou and others, *The TOSTAN Program. Evaluation of a Community Base Education Program in Senegal*, Population Council – GTZ – Tostan, August 2004

FINAL CONCLUSIONS ON TOSTAN PROGRAMME*

The convention theory, as reflected by events in the Senegalese villages, suggests a tripartite strategy of abandonment: basic education, public discussion, and public declaration. Educational information must be from a credible source and must be nondirective. Public discussion is the period when a motivated core carries information to ever broader audiences. Information and discussion are standard techniques. What this approach adds, and explains, is public declaration within the local pool of marriage eligibles, and results are promising.

Campaigns of broad publicity should continue because it is important that international, national, and local attitude change should continue to amass. Although it is not possible to explain why here, the critical mass definitely need not be as large as a majority. Nevertheless, some sufficient proportion of attitude change is required prior to convention shift, and that begins with broad publicity. Abandonment once begun is potentially contagious, and that has implications for reform planning. It is contagious because if one marriage pool successfully abandons FGC that directly raises the issue to overlapping marriage pools, and additionally because it demonstrates to similar populations that the beneficial shift can be made safely. Thus, it may be worthwhile to sharply concentrate effort on attitude change and then convention shift on some exemplary groups, and after success on their kin and neighbors and then on their coethnics. Concentration can operate at neighborhood, local, provincial, country, and regional levels.

Here are some more ideas about concentration. Generally, women more actively perpetuate FGC than do men. It is women's business. It may be possible to concentrate initially on women because if they are won over, they will persuade husbands, grandparents, religious and political figures. Of course it is also effective to win over influentials, local political and religious leaders with genuine authority. Obviously, it is desirable to expand as rapidly as possible the declarations in Senegal. If the Senegalese process continues to deliver dramatic results, then proven techniques should be extended to coethnics in neighboring countries. Further, it may be easier initially to inspire attitude change and convention shift in countries or regions where there are respected ethnic groups that have never practiced FGC (as evidenced by the first successes in Senegal and Uganda). Another criterion for concentration is if the discrepancy between prevalence and attitude change is wide, as in Eritrea (unfortunately, trapped in tragic warfare at the moment). Additionally, it may be easier initially to trigger change in groups where FGC is shallow, that is, in groups towards the edges of the distribution without the exaggerated emphasis on chastity and fidelity, than in groups where FGC is deep, that is, in groups at the center of the distribution that are strongly connected to the modesty code.

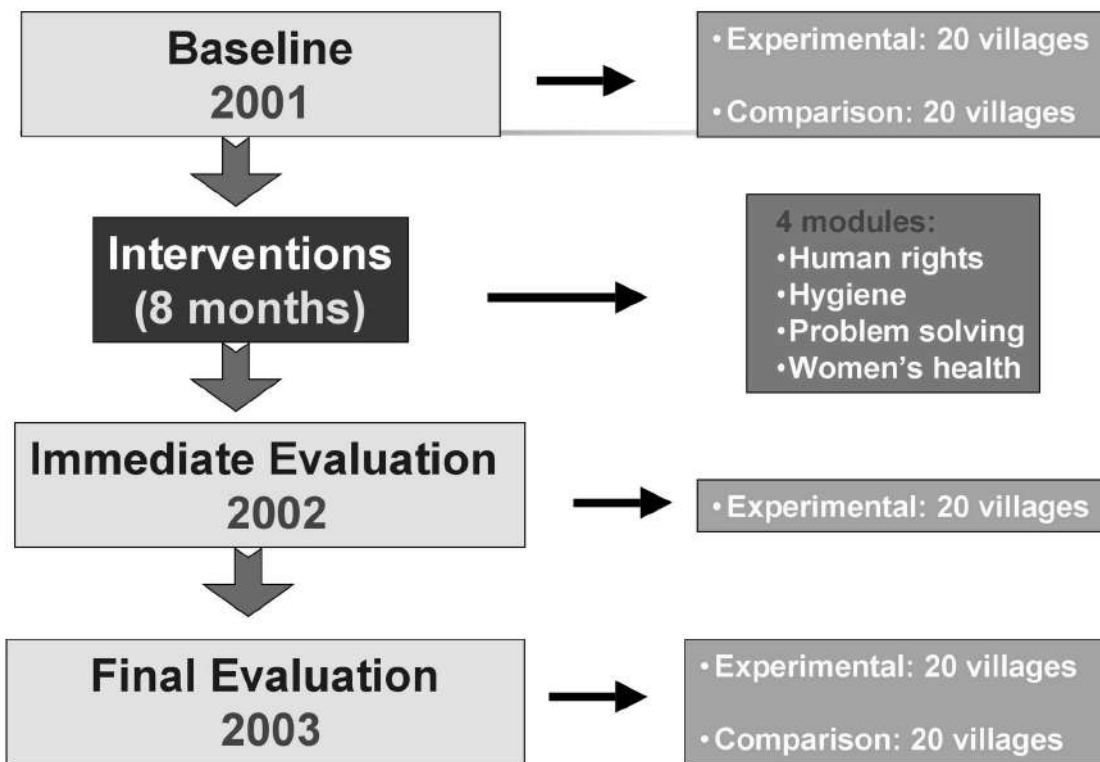

It would be instructive to test culturally adapted pledge associations in an urban area where there is already a wide discrepancy between prevalence and attitudes. The larger and more educated the population the easier it should be for those with changed attitudes to marry one another's children, provided there is a way they can

find one another (it might be harder initially to reach the less educated in an urban area, however, if they are less socially cohesive there than they were in their rural homes). Further, an urban suitor may not consider that many more partners than a rural suitor, but in the urban area there are many overlapping marriage markets as compared to only a few in a rural area. Thus, on a higher level, if, within a larger collection of overlapping marriage markets, a critical mass of marriage markets complete convention shifts, their overlap with other marriage markets can domino through the larger collection. No ethnic or status group anywhere should be ignored if they are ready for convention shift – successes are always more helpful for demonstration purposes than are failures. But all else equal, in an urban setting it may be most effective to concentrate on the most prestigious status groups, because their shift will inspire a shift among those who aspire to join those categories, and so on. These are provisional hypotheses, to be revised or rejected on the basis of program experiences.

The people who do FGC are honorable, upright, moral people who love their children and want the best for them. That is why they do FGC, and that is why they will decide to stop doing it, once a safe way of stopping is found. Since FGC will end sooner or later, it is better that we put our efforts into ending it sooner rather than later. Let's study good ways of stopping it, and let the people who still do FGC know what we and their neighbors in Africa have found out about ending it.

Significant increase of women that share information on FGC with others in experimental group

Significant increase of discussion about FGC in the experimental village during the past 12 months

COMMUNITY BASED MONITORING AND EVALUATION METHODOLOGIES

As mentioned earlier the component of building community consensus and support forms a vital element within the WECC framework. Involving the community in monitoring allows for further sustainability of the project, creating a sense of ownership amongst community members. There are different approaches in how to involve the community in a participatory manner. Using participatory approaches and participatory monitoring & evaluation differs from the more conventional approaches to monitoring and evaluation in that it aims to engage key stakeholders more actively in reflecting and assessing the progress of their project and in particular the achievement of results. Over the past years, participatory approaches have gained an increased popularity in the field of development and are being adopted more in developmental programs.

Some Key Principals of Participatory Monitoring and Evaluation, adapted from CIDA Result-based Participatory Monitoring and Evaluation, 2001, include:

- **'Participation'** - which means opening up the design of the process to include those most directly affected, and agreeing to analyse data together;
- The inclusiveness of PM&E requires **'negotiation'** to reach agreement about what will be monitored or evaluated, how and when data will be collected and analysed, what the data actually means, and how findings will be shared, and action taken;
- **'learning'** which becomes the basis for subsequent improvement, change and action
- • Since the number, role, and skills of stakeholders, the external environment, and other factors change over time, **'flexibility'** is essential.
- The importance of "handing over the stick" and creating the space for **respect and participation**

*Living with the community and **integrating** oneself with the local customs*

There are a wide range of methods and tools that have been developed to carry out participatory monitoring and evaluation. They all seek to compare the situation before and after a particular intervention, of set of events. The following are a few examples:

Visualised analysis - Visualisation techniques provide opportunities for creative reflection because they enable people to represent their own ideas in a way which they can discuss modify and extend. Examples of some of these methods include; participatory mapping; photograph analysis; flow diagrams; Venn diagrams; daily and activity profiles; pie diagrams.

• **Interviewing and sampling methods** - Examples of such techniques include; semi-structured interviewing; direct observation; focus group discussions; key informants; social maps.

• **Group and team dynamics method** - Examples of such techniques include; team review sessions; interview guides; villager and shared presentations; process notes and diaries.

Community Based Monitoring for FGM/C

Using community based monitoring techniques for FGM/C is still at a rudimentary stage. Different Settings for Conducting the Monitoring could be at existing points of services such as:

- Health services (e.g. women attending antenatal clinics, family planning clinics or child immunization)
- Education services (e.g. at primary or elementary schools through the teachers or nurses within the schools).

For all of the above, staff training may be required to notice changes amongst girls at risk, being able to identify and differentiate between the different types, etc and also understanding the social and cultural setting within which they are working. There are ethical and regulatory considerations that need to be clarified in monitoring with special attention to informed consent.

Examples of Different techniques for Community Based Monitoring of FGM/C

Voluntary Self reporting - Voluntary self reporting, such as parents reporting on the status of their daughters before & after the project intervention. Unfortunately self-reporting brings in issues of validity, reliability and in some cases deception, such as occurred in the longitudinal study of the reproductive health project in Navrongo, Ghana. In Egypt following the Egyptian Demographic and Health Survey in 1995, a comparison of self reporting with clinical findings was performed by the Egyptian Fertility Care Society in 1996, to allow for assessment of self reporting for a sample of 1339 women in eleven clinics, with clinical examinations undertaken by gynaecologists. The findings unveiled a 6% discrepancy between the self-reporting (97%) and the actual clinical findings (93%), which is within the statistically acceptable variable. In this case self-reporting was closely compatible with clinical findings.

Observation of Cut status - Observation of cut-status after the project intervention provides an ultimate indicator of whether the girl is cut or not, but it is very hard to measure with there being ethical and rights considerations. Observation of cut status can be done through routine pelvic examination of gynaecological patients and during antenatal care and delivery. This method of data gathering is non-invasive but compromises on lack of full representation of the sample.

Community Based Monitoring through “CARE” Methodology

As seen above there are different issues which arise in how community based monitoring is conducted. Based on this, we recommend using a Creative, Appropriate Reliable and Ethical (CARE) method, which might assist in providing guidelines on which techniques and tools could be used in a particular setting. As the Publicly Declared Intent (PDI) is currently the first recommended indicator for assessing impact, it can be integrated within the monitoring systems developed. As an example through developing of a monitoring system which will track record the status of families whom have declared that they will not circumcise their girls, through an interview, a public declaration or announcement and follow up through

routine visits. Such a follow up undertaken by the community is currently being undertaken by the **Positive Deviants** approach, which uses a surveillance monitoring through records and family visits of at risk girls:

*“Families of girls at risk tracking: after 6 months, the focus shifts to the girls at risk families. The local NGOs, with the Positive Devian (PD), define the meaning of ‘at risk.’ They decide the at risk age, working on the specific community, and they also do mapping, trace and write-down all the families that have girls, then during the workshop they discuss with each other (local NGO’s & PDs) and define & decide what the at-risk age in the given community. Every positive deviant chooses families, which they will be responsible for, for close monitoring. At this stage focus is on the family, there is a kind of **tailoring**, the intervention itself is not pre-made. Local team, the PD’s, will keep on monitoring and tracking...an on-going interaction that supposedly will go on very closely. After speaking with each one of the family members, they decide how they can intervene, in order to reach that step of stopping FGM. The shape of how it is done is for the PD’s to decide. Becoming a community ownership...not a project at this stage...PD’s supposedly continue monitoring & tracking, which goes on until the girl is not longer at risk.”*

Positive Deviants Methodology described by Sahar Mashhour, Grants Program Manager, CEDPA

Drop in Incidence and Prevalence

Drop in incidence rates can be measured through community monitoring. Drop in prevalence rates can be measured through repeat national surveys such as the DHS or through independent local pre and post intervention surveys or through case control studies.

Activity 4

5

MAINSTREAMING FGM/C PREVENTION: DEVELOP YOUR PROGRAM

Time: 8 hours

Why do this activity?

This activity builds on the lessons learned in the previous modules, and offers a practical opportunity to develop a programme/project addressing one or more typical development issues (draughts and water shortages, poverty and reduced economic opportunities, lacking healthcare facilities, etc.) as an entry point to mainstream FGM/C prevention activities by empowering women and involving the community at large.

In fact, the analysis carried out during the previous modules has brought to the conclusion that FGM/C will come to an end when women themselves feel that they can abandon the practice without losing what the practice guarantees to them: survival and security through marriage, reproduction and social recognition for their children, dignity and an accepted social role, including freedom of movement and some decision making.

The “gender spectacles” we have put on during this training course will allow us to recognize the “practical gender needs” as well as the “strategic gender needs” that crosscut with FGM/C.

This in turn will permit to identify target groups, objectives, appropriate messages, and follow them up through the different “stages of behavioural change”, understanding which are the necessary interventions, resisting adverse pressure, and arrive to the point where the whole community have reached a consensus on the abandonment of FGM/C, and make it public through some sort of “public declared intent”.

The programme should be designed in order to build the supportive social and cultural environment that is necessary for women and families to adopt a different behaviour: ingredients for this environment include information through the media as well as policy and laws. Moreover, the proposed method will help to identify activities to be implemented in order to uphold the decision to abandon the practice, and to allow a smooth transition to a new collective behaviour.

Objectives

- To experiment the learned skills for effective programming, including “gender planning”, “stages of behavioural change” and the “women empowerment and community consensus” inputs.

- To define concrete paths to mainstream FGM/C prevention activities into different development programmes in order to bring about a long lasting behavioural change.

How to do the activity:

Step 1: 1 hour

Divide participants into small groups. Distribute Handout 2, 3 and 4 with the description of three districts of Sudan in the needed number of copies depending on how many small groups have been created.

Distribute a copy of the Handout 1 “Programming tool for mainstreaming FGM/C prevention in development programs and projects” and Handout 5 “Reminder for project development” to participants, and go through the first one in plenary, revising each step.

Programming tool for mainstreaming FGM/C prevention in development program and projects

Based on **Gender planning theory and practice** developed by economist Caroline Moser and extensively used by AIDOS in its overall development activity, and on the Women empowerment and community consensus (WECC) model developed by RAINBO, the innovative tool for mainstreaming FGM/C prevention in development program and projects includes the following steps:

1. Conduct gender / situational analysis
2. Prioritisation of development problems
3. Identify working objectives for women’s empowerment without FGM/C
4. Identify the entry strategy / access to community
5. Expand the room for manoeuvre / choose project inputs for women’s empowerment and community consensus
6. Conduct progressive monitoring to adjust project to changes and avoid resistances.

1. Gender / situational analysis

- disaggregate target groups within the community
- look at household structure (family... extended)
- look at roles played by women and men, both in the household and in the community
- look at access / control over resources (including money, time, education, self esteem/value, reproduction, information, political participation...)
- identify gatekeepers: controlling women’s socialization and ensuring FGM/C
- identify stages of behavioural and social change of community members
- collect data/quality information on FGM/C “here and now”

This analysis will ultimately lead to

- **identify practical gender needs (PGN) an strategic gender needs (SGN) of women**
- **identify development needs of the community**

Practical gender needs (PGN) are the needs of men and women by virtue of their position within the gender division of roles and labour in a given

Plenary introduction

Handout

Note to facilitator

society. It is usually a response to an immediate need. For example in a rural society, to have water near the household is a PGN for women, which is part of their responsibility within the gender division of labour. If we look at health, having access to family planning is a PGN for women. PGN are aimed at actions which make the performance of existing gender roles more efficient.

Strategic gender needs (SGN), on the contrary, are derived by the subordinate position of women with respect to men. They reflect an alternative for a more equitable division of labour.

Data and quality information on FGM/C “here and now” might be gathered answering to the following questions:

- FGM/C prevalence rate among women and girls?
- What type of FGM/C is performed?
- Who performs the practice?
- Which is the age at performance?
- What are the main reasons given by women / community members to justify/support FGM/C?
- Which are the attitudes towards the possibility of abandoning the practice?
- What people know about FGM/C?
- Where there previous campaigns/interventions?
- Is FGM/C perceived as a power gaining tool by women?

2. Prioritisation of development problems

Build a “cause and effect” list of development problems for the community and for the women especially, and choose to address those that offer the best entry point(s) to include activities aiming at preventing/abandoning FGM/C, through the achievement of

- empowerment of women without FGM/C
- community consensus around the changes in behaviour that empowerment of women without FGM/C entails

3. Identify working objectives for women’s empowerment without FGM/C

Use **gender consultation** and **community dialogue** to identify the **working objectives**, which are the objectives directly linked to the achievement of strategic gender needs (SGN) of women, and that will be monitored along the whole project time framework, in order to adjust them to changes emerging along progress of project implementation.

Through gender consultation and community dialogue:

- identify the **entry strategy** to meet SGN of women, thus bringing a change in traditional gender roles and gender socialization processes
- identify **stages of behavioural change** that different social actors (target groups) are already going through
- identify **assets = supporters** of the abandonment of FGM/C (and eventually to women’s empowerment) and **constraints = resisters**, in order to build the necessary community consensus to meet SGN
- build a **data baseline** against which **monitor progress** and redefine ongoing working objectives, adapted to changing power dynamics

4. identify the entry strategy / access the community

Look at power dynamics and stages of behavioural/social change (adopters of innovation), and answer to the following questions:

- what is possible to do?
- what is NOT possible to do? (because it will elicit resistance / refusal by community and/or by specific actors, such as community leaders, elders, religious leaders..)
- who is ready to contribute/support women's empowerment?
- who will openly oppose it?
- how should the issue of FGM/C be addressed?

This will allow to define the **room for manoeuvre** for the project/program.

5. Expand the room for manoeuvre / choose project inputs for women's empowerment and community consensus inputs

The room for manoeuvre, the acceptance of the project by the community and the active participation of their members to project activities, can be expanded through activities aimed at women's empowerment without FGM/C and at community consensus around it:

- choose development areas where gender equality/women's empowerment will benefit the whole community
- choose areas where FGM/C is perceived as a power gaining tool by women
- build supportive structures/institutions for women's empowerment, including full participation of women
- choose appropriate message (cultural sensitive)
- work with supporters (assets) to move resisters (constraints) towards a different grade of acceptance of the innovation (new behaviour: abandoning FGM/C)
- move to collective decision making: **public declared intent to change behaviour/public declaration to abandon FGM/C**
- build a conducive and sustainable environment for change, where new gender roles and power balances, including the abandonment of FGM/C, can be maintained

6. Conduct progressive monitoring

- Look at women's empowerment without FGM/C. Thus through the project's activities women **gained**
 - power over...
 - power to...
 - power with...
 - power within...
- Use quantity/quality data/information gathered through gender/situational analysis as a baseline: what changed in the community after intervention?
- Look at social change: which changes in stages of behaviour happened among the project's target groups?
- Identify unexpected results: where there positive/negative unexpected outcomes of activities implemented during the project?

7. Move forward / scale up

The results of the monitoring process will contribute to the definition of **new working objectives** and a renewed **entry strategy** to further expand the room for manoeuvre to achieve women's empowerment without FGM/C, build community consensus around it and improve overall development conditions of the community.

Progressive monitoring and final evaluation will also contribute to:

- define how to scale up activities
- identify possibilities for adaptation and/or replication of project activities in other areas
- include other stakeholders/target groups in project activities.

Small group activity**Step 2: 5 hours**

Invite participants in the small groups to develop their project proposal to address one of the specific development problems emerging from the District description, using the combined programming tools in the Handout, and considering the following while developing their proposal:

1. address practical / strategic gender needs, thus contributing to women's self empowerment
2. addressing community needs in order to open up entry points and build the social and cultural environment favouring behavioural change
3. aim at reaching a community consensus on the abandonment of FGM/C stated through a "public declaration" in order to have a tool for later monitoring lasting decision
4. include appropriate indicators to monitor implementation of activities.

Invite each group to work only on one specific development issue and to list minimum 3 messages they deem appropriate for each activity/target group. Write on the flipchart the shape that the presentation to plenary of each working group should take (see list below).

Ask each group to present their project/program according to following model (also included in Handout 2, "Reminder for project development and presentation"):

**Note to facilitator****Reminder for project development and presentation**

1. Short presentation of the district (read from case study)
2. Results of situational and gender analysis: describe condition of women and of community
3. Practical / strategic needs identified/chosen and development problem prioritised
4. Working objectives for women's empowerment without FGM/C
5. Stages in behavioural change: who are the supporters/assets and who the resistors/constraints towards women's empowerment without FGM/C?
6. Entry strategy/access to community
7. Expand the room for manoeuvre: list project activities according to target group
8. Messages selected
9. Move to decision stage: which form of "public declared intent" to abandon the practice is foreseen?
10. Indicators for monitoring activities
11. Activities to ensure maintenance of decision taken and reinforce behavioural change process (empowerment of women).

Step 3: 2 hours

Ask each group to present their programme/project. Invite comments and appreciation by other participants.

Materials

- Flipchart
- Felt tipped pens
- Handouts for the small groups

Handouts

- Handout 1: Programming tool for mainstreaming FGM/C prevention in development program and projects
- Handout 2: Reminder for project development and presentation
- Handout 3: Scenario 1
- Handout 4: Scenario 2
- Handout 5: Scenario 3

PROGRAMMING TOOL FOR MAINSTREAMING FGM/C PREVENTION IN DEVELOPMENT PROGRAM AND PROJECTS

Based on **Gender planning theory and practice** developed by economist Caroline Moser and extensively used by AIDOS in its overall development activity, and on the Women empowerment and community consensus (WECC) model developed by RAINBO, the innovative tool for mainstreaming FGM/C prevention in development program and projects includes the following steps:

1. Conduct gender / situational analysis
2. Prioritisation of development problems
3. Identify working objectives for women's empowerment without FGM/C
4. Identify the entry strategy / access to community
5. Expand the room for manoeuvre / choose project inputs for women's empowerment and community consensus
6. Conduct progressive monitoring to adjust project to changes and avoid resistances.

1. Gender / situational analysis

- disaggregate target groups within the community
- look at household structure (family... extended)
- look at roles played by women and men, both in the household and in the community
- look at access / control over resources (including money, time, education, self esteem/value, reproduction, information, political participation...)
- identify gatekeepers: controlling women's socialization and ensuring FGM/C
- identify stages of behavioural and social change of community members
- collect data/quality information on FGM/C "here and now"

This analysis will ultimately lead to

- **identify practical gender needs (PGN) and strategic gender needs (SGN) of women**
- **identify development needs of the community**

Practical gender needs (PGN) are the needs of men and women by virtue of their position within the gender division of roles and labour in a given society. It is usually a response to an immediate need. For example in a rural society, to have water near the household is a PGN for women, which is part of their responsibility within the gender division of labour. If we look at health, having access to family planning is a PGN for women. PGN are aimed at actions which make the performance of existing gender roles more efficient.

Strategic gender needs (SGN), on the contrary, are derived by the subordinate

position of women with respect to men. They reflect an alternative for a more equitable division of labour.

Data and quality information on FGM/C “here and now” might be gathered answering to the following questions:

- FGM/C prevalence rate among women and girls?
- What type of FGM/C is performed?
- Who performs the practice?
- Which is the age at performance?
- What are the main reasons given by women / community members to justify/support FGM/C?
- Which are the attitudes towards the possibility of abandoning the practice?
- What people know about FGM/C?
- Where there previous campaigns/interventions?
- Is FGM/C perceived as a power gaining tool by women?

2. Prioritisation of development problems

Build a “cause and effect” list of development problems for the community and for the women especially, and choose to address those that offer the best entry point(s) to include activities aiming at preventing/abandoning FGM/C, through the achievement of

- empowerment of women without FGM/C
- community consensus around the changes in behaviour that empowerment of women without FGM/C entrains

3. Identify working objectives for women’s empowerment without FGM/C

Use **gender consultation** and **community dialogue** to identify the **working objectives**, which are the objectives directly linked to the achievement of strategic gender needs (SGN) of women, and that will be monitored along the whole project time framework, in order to adjust them to changes emerging along progress of project implementation.

Through gender consultation and community dialogue:

- identify the **entry strategy** to meet SGN of women, thus bringing a change in traditional gender roles and gender socialization processes
- identify **stages of behavioural change** that different social actors (target groups) are already going through
- identify **assets = supporters** of the abandonment of FGM/C (and eventually to women’s empowerment) and **constraints = resistors**, in order to build the necessary community consensus to meet SGN

- build a **data baseline** against which **monitor progress** and redefine ongoing working objectives, adapted to changing power dynamics

4. identify the entry strategy / access the community

Look at power dynamics and stages of behavioural/social change (adopters of innovation), and answer to the following questions:

- what is possible to do?
- what is NOT possible to do? (because it will elicit resistance / refusal by community and/or by specific actors, such as community leaders, elders, religious leaders..)
- who is ready to contribute/support women's empowerment?
- who will openly oppose it?
- how should the issue of FGM/C be addressed?

This will allow to define the **room for manoeuvre** for the project/program.

5. Expand the room for manoeuvre / choose project inputs for women's empowerment and community consensus inputs

The room for manoeuvre, the acceptance of the project by the community and the active participation of their members to project activities, can be expanded through activities aimed at women's empowerment without FGM/C and at community consensus around it:

- choose development areas where gender equality/women's empowerment will benefit the whole community
- choose areas where FGM/C is perceived as a power gaining tool by women
- build supportive structures/institutions for women's empowerment, including full participation of women
- choose appropriate message (cultural sensitive)
- work with supporters (assets) to move resistors (constraints) towards a different grade of acceptance of the innovation (new behaviour: abandoning FGM/C)
- move to collective decision making: **public declared intent to change behaviour/public declaration to abandon FGM/C**
- build a conducive and sustainable environment for change, where new gender roles and power balances, including the abandonment of FGM/C, can be maintained

6. Conduct progressive monitoring

- Look at women's empowerment without FGM/C. Thus through the project's activities women **gained**

- power over...
- power to...
- power with...
- power within...

- Use quantity/quality data/information gathered through gender/situational analysis as a baseline: what changed in the community after intervention?
- Look at social change: which changes in stages of behaviour happened among the project's target groups?
- Identify unexpected results: where there positive/negative unexpected outcomes of activities implemented during the project?

7. Move forward / scale up

The results of the monitoring process will contribute to the definition of **new working objectives** and a renewed **entry strategy** to further expand the room for manoeuvre to achieve women's empowerment without FGM/C, build community consensus around it and improve overall development conditions of the community.

Progressive monitoring and final evaluation will also contribute to:

- define how to scale up activities
- identify possibilities for adaptation and/or replication of project activities in other areas
- include other stakeholders/target groups in project activities

REMINDER FOR PROJECT DEVELOPMENT AND PRESENTATION

1. Short presentation of the district (read from case study)
2. Results of situational and gender analysis: describe condition of women and of community
3. Practical / strategic needs identified/chosen and development problem prioritised
4. Working objectives for women's empowerment without FGM/C
5. Stages in behavioural change: who are the supporters/assets and who the resisters/constraints towards women's empowerment without FGM/C?
6. Entry strategy/access to community
7. Expand the room for manoeuvre: list project activities according to target group
8. Messages selected
9. Move to decision stage: which form of "public declared intent" to abandon the practice is foreseen?
10. Indicators for monitoring activities
11. Activities to ensure maintenance of decision taken and reinforce behavioural change process (empowerment of women).

SCENARIO 1

Wad Sharifae is a large settlement with good transportation to nearby city of Kassala, in Sudan. The settlement has an unofficial subdivision in a East and West zones, roughly corresponding to the ethnic division of people of West African origins and others. The division among the 2 settlement is quite invisible, as both make use of the same market. The Eritrean border is at 35 km, and recently a refugee camp has been located in the surroundings. Around 14.000 people live in Wad Sharifae. Ethnic composition includes the Beni Amer, one of the nomadic population of eastern Sudan, Hadendawa and House, mainly concentrated in West Was Sharief. Many Eritrean or people pf Eritrean origin also live here.

Economic situation is quite good, with irrigated orchards, herding, brick making, urban employment and day labour. There are 7 basic schools for boys and 7 for girls (grade 1-8), there is one high school for boys only. There are also 10 Coranic schools. Although illiteracy remains high among women, it is estimated that 60 per cent of the population has some degree of education. Schools are in a very deplorable state, and teachers complain the lack of government support for education.

The most prominent groups of Muslims are the Khatmiyya, a traditional Sufi group quite numerous in Eastern Sudan, and the Ansar Sunna, a Wahhabist oriented religious movement with close ties to Saudi Arabia. Pharaonic circumcision is quite diffuse, 57 per cent of girls aged 5-11 years have already been submitted to infibulation. Political and religious leaders from the Ansar Sunna movement often criticize Sudanese traditions, including girls circumcision and parts of the traditional wedding celebration. A wedding now consists of just a contract signing and a large, segregated gathering for a meal, after which the groom takes the bride home. They also restrict the movement of women requiring them to be accompanied by others and wearing black veils when moving beyond family's compound.

SCENARIO 2

Hameshkoreib akil Jadida, in Sudan, is a community that is spread over a fairly large area located about 15 km east of Aroma by dirt track and 75 km from Kassala, with a paved road between Aroma and Kassala. Wind blows all the time. Nearly all the people identify as Hadendawa, an ethnic group that is considered one of the Beja people of eastern Sudan. The Hadendawa speak their own language among themselves, men also know Arabic well, but women don't, so that one woman has always to translate for the others. The children learn Arabic when they get older, at school. The village is composed by different "gabila" (tribes), each with its own sheikh. Housing is mostly mud brick round with straw shaded shelters. But a consistent number of houses consist of the traditional nomadic structures that can be relocated easily. There is a relevant problem with supply of clean water as well as with sanitation, with no latrines near a large number of houses and people simply using the bushes. Poverty is widespread, in particular in the dry season. Agriculture is the main source of revenue, but many women revealed that their husband and brothers have migrated to Port Sudan.

Women have almost none income generating activities. The Hadendawa people of this community strongly adhere to cultural values and traditions of its previous pastoral life, with close proximity among families, endogamous marriages (close intra-marriage, preferably with paternal first cousin). Patriarchal power is manifested in well defined gender roles, including women's segregation, rigid assigned workloads, deference and obedience to male relatives. However women are not powerless, exerting a great deal of influence in the family and community contributing to reputation of community members.

All the community, men and women, is very supportive of pharaonic circumcision, and until a few years ago never heard about "sunna". This is considered a topic that should not be discussed in public. Not being infibulated is considered shameful by women, although they know/remember the pain associated with it.

SCENARIO 3

Tuwaifra is a large community in West Kardofan in Sudan, of about 6.000 people, founded originally in 1906 by Hammar people. It expanded in 1956 when the deep bore hole and pumping station were established at the end of the colonial period, transforming the village in a major water point for the area. The Ma'alia were the first group to be settled here. Actual ethnic composition includes Ma'alia, Berti and Hammar, with a smaller minority of Dinka. Each community has its own sheikh, who cooperate together.

Local authorities comprehend also the director of the school, a village council, and a committee under the Community development committee organized as part of a development project by a local NGO. Tuwaifra has no medical facility. There is a licensed midwife in the community, but the lack of regular healthcare is a major problem for the community. There are a few traditional healers, although not an herbalist but only a “boonsetter” and people who threat using the Qu'ran. The nearest hospital is at a 2 hours long drive.

There are no statistics concerning maternal and infant mortality, but these seem lower then in the past. The local school serves grades 1-8, with one book for every student only, no library, not convenient supply of drinkable water. Many girls drop out of school very early because of marriage: in grade 8 there are at present 15 boys and only 4 girls. Only a few girls in the story of the village have had higher education than grade 8.

FGM/C is performed in town, although there are no quantitative data available. People seem to have an open position towards the abandonment of the practice after some awareness raising interventions, in particular the men and some younger women, such the trained midwife. Another relevant change, according to one of the ethnic sheikh, is substitution of infibulation (pharaonic excision) with sunna. What is meant really in practice by “sunna” is not clear.
